Preface	xix
Editorial remarks	xxi
Authors (their contributions to the NMSOP and addresses)	xxv

CHAPTER 1: Aim and Scope of the IASPEI New Manual of Seismological Observatory Practice (P. Bormann)

1.1 History of the Manual	1
1.2 Scope of the NMSOP	3
1.2.1 Historical and general conceptual background	3
1.2.2 Creation of awareness	7
1.2.2.1 The magnitude issue	7
1.2.2.2 Consequences of recent technical developments	9
1.2.2.3 The need for secondary phase readings	10
1.2.2.4 New seismic sensors and sensor calibration	12
1.2.2.5 What has to be considered when installing new seismic networks?	13
1.3 Philosophy of the NMSOP	13
1.4 Contents of the NMSOP	15
1.4.1 The printed manual	15
1.4.2 The NMSOP website (E. A. Bergman)	16
1.5 Outreach of the NMSOP	17
Acknowledgments	18
Recommended overview readings	18

CHAPTER 2: Seismic Waves and Earth Models (P. Bormann, E. R. Engdahl and R. Kind)

2.1 Introduction	1
2.2 Elasticity moduli and body waves	2
2.2.1 Elastic moduli	2
2.2.2 Stress-strain relationship	4
2.2.3 P- and S-wave velocities, waveforms and polarization	6
2.3 Surface waves	11
2.3.1 Origin	11
2.3.2 Dispersion and polarization	13

Contents Volume 1 & 2

2.3.3	Crustal surface waves and guided waves	17
2.3.4	Mantle surface waves	19
2.4	Normal modes	21
2.5	Seismic rays, travel times, amplitudes and phases	24
2.5.1	Introduction	24
2.5.2	Huygen´s and Fermat´s Principle and Snell´s Law	25
2.5.2.1	Snell´s Law for a flat Earth	26
2.5.2.2	Snell´s Law for the spherical Earth	26
2.5.3	Rays and travel times in laterally homogeneous (1-D) media	27
2.5.3.1	Velocity gradient	27
2.5.3.2	Effect of a sharp velocity increase	28
2.5.3.3	Effect of a low-velocity zone	31
2.5.3.4	Refraction, reflection, and conversion of waves at a boundary	32
2.5.3.5	Seismic rays and travel times in homogeneous models with horizontal and tilted layers	33
2.5.3.6	Wiechert-Herglotz inversion	35
2.5.4	Amplitudes and phases	36
2.5.4.1	Energy of seismic waves	36
2.5.4.2	Wave attenuation	37
2.5.4.3	Phase distortions and Hilbert transform	39
2.5.4.4	Effects not explained by ray theory	40
2.6	Seismic phases and travel times in the real Earth	42
2.6.1	Seismic phases and travel times from local and regional seismic events	43
2.6.2	Seismic phases and travel times at teleseismic distances	47
2.7	Global Earth models (E. R. Engdahl)	57
2.8	Synthetic seismograms and waveform modeling (R. Kind, P. Bormann)	63
	Acknowledgments	70
	Recommended overview readings	70

CHAPTER 3: Seismic Sources and Source Parameters

(P. Bormann, M. Baumbach †, G. Bock †, H. Grosser, G. L. Choy and J. Boatwright)

3.1	Introduction to seismic sources and source parameters (P. Bormann)	1
3.1.1	Types and peculiarities of seismic source processes	1
3.1.1.1	Tectonic earthquakes	2
3.1.1.2	Volcanic earthquakes	4
3.1.1.3	Explosions, implosions and other seismic events	4
3.1.1.4	Microseisms	6
3.1.2	Parameters which characterize size and strength of seismic sources	6
3.1.2.1	Macroseismic intensity	6
3.1.2.2	Magnitude and seismic energy	7
3.1.2.3	Seismic source spectrum, seismic moment and size of the source area	7
3.1.2.4	Orientation of the fault plane and the fault slip	10
3.1.3	Mathematical source representation	12
3.1.4	Detailed analysis of rupture kinematics and dynamics in space and time	12
3.1.5	Summary and conclusions	15

3.2	Magnitude of seismic events (P. Bormann)	16
3.2.1	History, scope and limitations of the magnitude concept	16
3.2.2	General assumptions and definition of magnitude	18
3.2.3	General rules and procedures for magnitude determination	19
3.2.4	Magnitude scales for local events	23
	3.2.4.1 The original Richter magnitude scale M_I	24
	3.2.4.2 Other M_I scales based on amplitude measurements	25
	3.2.4.3 Duration magnitude M_d	27
3.2.5	Common teleseismic magnitude scales	29
	3.2.5.1 Surface wave magnitude scale M_s	30
	3.2.5.2 Magnitude scales for teleseismic body waves	33
	3.2.5.3 Moment magnitude M_w	36
3.2.6	Complementary magnitude scales	36
	3.2.6.1 Mantle magnitude M_m	36
	3.2.6.2 Energy magnitude M_e	37
	3.2.6.3 Broadband and spectral P-wave magnitude scales	38
	3.2.6.4 Short-period P-wave magnitude scale	40
	3.2.6.5 Short-period PKP-wave magnitude	42
	3.2.6.6 Lg-wave magnitudes	42
	3.2.6.7 Macroseismic magnitudes	43
	3.2.6.8 High-frequency moments and magnitudes	45
	3.2.6.9 Tsunami magnitudes	46
3.2.7	Relationships among magnitude scales	46
3.2.8	Summary remarks about magnitudes and their perspective	49
3.3	Radiated seismic energy and energy magnitude (G. L. Choy, J. Boatwright)	50
3.3.1	Introduction	50
3.3.2	How is radiated seismic energy measured?	51
	3.3.2.1 Method	51
	3.3.2.2 Data	53
3.3.3	Development of an energy magnitude, M_e	54
3.3.4	The relationship of radiated energy to moment and apparent stress	55
3.3.5	The relationship of M_e to M_w	56
3.3.6	Regional estimates of radiated seismic energy	57
3.3.7	Conclusions	57
3.4	Determination of fault-plane solutions (M. Baumbach †, H. Grosser)	58
3.4.1	Introduction	58
3.4.2	Manual determination of fault-plane solutions	62
3.4.3	Accuracy of fault-plane solutions	69
3.4.4	Computer-assisted fault-plane solutions	69
3.5	Source parameters and moment-tensor solutions (G. Bock †)	71
3.5.1	Introduction	71
3.5.2	Basic relations	71
3.5.3	An inversion scheme in the time domain	74
3.5.4	Decomposition of the moment tensor	77
3.5.5	Steps taken in moment-tensor inversion	78
3.5.6	Some methods of moment-tensor inversion	79
	3.5.6.1 NEIC fast moment tensors	79
	3.5.6.2 Harvard CMT solutions	79
	3.5.6.3 EMSC rapid source parameter determinations	80
	3.5.6.4 Relative moment-tensor inversion	80

3.5.6.5 NEIC broadband depths and fault-plane solutions	80
3.6 Seismic scaling relations (P. Bormann)	82
3.6.1 Definition and use of seismic scaling relations	82
3.6.2 Energy-magnitude-moment relations	82
3.6.3 Moment-magnitude relations	85
3.6.4 Scaling relations of M , M_0 and E_S with fault parameters	86
3.6.5 Similarity conditions	93
Acknowledgments	93
Recommended overview readings	94

CHAPTER 4: Seismic Signals and Noise (P. Bormann)

4.1 Nature and presentation of seismic signals and noise	1
4.1.1 Seismic signals	1
4.1.2 Seismic noise	3
4.1.3 Conversion of spectral amplitudes or power densities into recording amplitudes	8
4.2 Peculiarities of signal appearance in seismic records	11
4.2.1 Influence of the seismograph response: Empirical case studies	11
4.2.2 Theoretical considerations on signal distortion in seismic records	14
4.3 Causes and characteristics of ambient seismic noise	18
4.3.1 Ocean microseisms and ocean bottom noise	18
4.3.2 Short-period seismic noise	21
4.3.3 Long-period seismic noise	24
4.4 Measures for improving the signal-to-noise ratio (SNR)	25
4.4.1 Frequency filtering	25
4.4.2 Velocity filtering and beamforming	26
4.4.3 Noise prediction-error filtering	27
4.4.4 Noise polarization filtering	28
4.4.5 SNR improvement by recordings in subsurface mines and boreholes	29
4.4.6 Signal variations due to local site conditions	31
Acknowledgments	33
Recommended overview readings	33

CHAPTER 5: Seismic Sensors and their Calibration (E. Wielandt)

5.1 Overview	1
5.2 Basic Theory	3
5.2.1 The complex notation	3
5.2.2 The Laplace transformation	4
5.2.3 The Fourier transformation	5
5.2.4 The impulse response	7
5.2.5 The convolution theorem	8
5.2.6 Specifying a system	9
5.2.7 The transfer function of a WWSSN-LP seismograph	9
5.2.8 The mechanical pendulum	13
5.2.9 Transfer functions of pendulums and electromagnetic seismometers	14

5.3	Design of seismic sensors	17
	5.3.1 Pendulum-type seismometers	17
	5.3.2 Decreasing the restoring force	18
	5.3.3 Sensitivity of horizontal seismometers to tilt	20
	5.3.4 Direct effects of barometric pressure	21
	5.3.5 Effects of temperature	21
	5.3.6 The homogeneous triaxial arrangement	22
	5.3.7 Electromagnetic velocity sensing and damping	23
	5.3.8 Electronic displacement sensing	23
5.4	Force-balance accelerometers and seismometers	24
	5.4.1 The force-balance principle	24
	5.4.2 Force-balance accelerometers	25
	5.4.3 Velocity broadband seismometers	25
	5.4.4 Other methods of bandwidth extension	27
5.5	Seismic noise, site selection and installation	28
	5.5.1 The USGS low-noise model	28
	5.5.2 Site selection	28
	5.5.3 Seismometer installation	29
	5.5.4 Magnetic shielding	30
5.6	Instrumental self-noise	31
	5.6.1 Electromagnetic short-period seismographs	31
	5.6.2 Force-balance seismometers	33
	5.6.3 Transient disturbances	34
5.7	Calibration	34
	5.7.1 Electrical and mechanical calibration	34
	5.7.2 General conditions	34
	5.7.3 Calibration of geophones	35
	5.7.4 Calibration with sinewaves	36
	5.7.5 Step response and weight-lift test	37
	5.7.6 Calibration with arbitrary signals	38
	5.7.7 Calibration of triaxial seismometers	40
	5.7.8 Calibration against a reference sensor	41
5.8	Procedures for the mechanical calibration	41
	5.8.1 Calibration on a shake table	41
	5.8.2 Calibration by stepwise motion	42
	5.8.3 Calibration with tilt	44
5.9	Free software	45
	5.9.1 Programs by J. Bribach in Turbo Pascal	45
	5.9.2 Programs by E. Wielandt in Fortran	45
	5.9.3 Free seismic software packages from other sources	46
	Acknowledgments	46

CHAPTER 6: Seismic Recording Systems (G. Asch)

6.1	Introduction	1
6.2	Analog signal preparation	2
	6.2.1 The Analog Signal Preparation section	2
	6.2.2 Analog filters	3
6.3	Analog to digital conversion	3

Contents Volume 1 & 2

6.3.1	Sampling theorem	4
6.3.2	Oversampling	6
6.3.3	Digital filters	8
6.3.4	Analog to Digital Converter (ADC)	8
6.3.5	Noise test	11
6.3.6	The Crystal chip set	12
6.3.7	The Quanterra family	14
6.4	Time base	14
6.5	Data management	15
6.5.1	Storage Media	15
6.5.2	Data formats, compression and metadata	16
6.6	Conclusions and final remarks	18
6.7	Glossary of technical terms and links	18
	Acknowledgments	20
	Recommended overview readings	20

CHAPTER 7: Site Selection, Preparation and Installation of Seismic Stations

(A. Trnkoczy, P. Bormann, W. Hanka, L. G. Holcomb and R. L. Nigbor)

7.1	Factors affecting seismic site quality and site selection procedure (A. Trnkoczy)	1
7.1.1	Introduction	1
7.1.2	Offsite studies	2
7.1.2.1	Definition of the geographic region of interest	2
7.1.2.2	Seismo-geological considerations	4
7.1.2.3	Topographical considerations	5
7.1.2.4	Station access considerations	5
7.1.2.5	Evaluation of seismic noise sources	5
7.1.2.6	Seismic data transmission and power considerations	8
7.1.2.7	Land ownership and future land use	8
7.1.2.8	Climatic considerations	8
7.1.3	Field studies	9
7.1.3.1	Station access verification	10
7.1.3.2	Local seismic noise sources and seismic noise measurements	10
7.1.3.3	Field study of seismo-geological conditions	12
7.1.3.4	Field survey of radio frequency (RF) conditions	12
7.1.3.5	Shallow seismic profiling	12
7.1.4	Using computer models to determine network layout capabilities	13
7.2	Investigation of noise and signal conditions at potential sites (P. Bormann)	15
7.2.1	Introduction	15
7.2.2	Reconnaissance noise studies prior to station site selection	16
7.2.2.1	Offsite assessment of expected noise levels and measurement of instrumental self-noise	16
7.2.2.2	Sensor installation, measurements and logbook entries in the field	18
7.2.2.3	Case study of noise records in the frequency range $0.3 \text{ Hz} < f < 50 \text{ Hz}$	20

7.2.3	Comparison of noise and signals at permanent seismological stations	25
7.2.3.1	Introduction	25
7.2.3.2	Data analysis	26
7.2.3.3	Results	27
7.2.4	Searching for alternative sites in a given network	31
7.2.4.1	Geological and infrastructure considerations	31
7.2.4.2	Recording conditions and data analysis of temporary noise measurements for alternative permanent broadband stations	32
7.2.4.3	Results of noise and signal measurements at BRNL and RUE	33
7.2.4.4	Results of noise and signal measurements at HAM and BSEG	35
7.2.4.5	Causes of spectral noise reduction at RUE and BSEG and conclusions	38
7.3	Data transmission by radio-link and RF survey (A. Trnkoczy)	39
7.3.1	Introduction	39
7.3.2	Types of RF data transmission used in seismology	39
7.3.3	The need for a professional radio frequency (RF) survey	41
7.3.4	Benefits of a professional RF survey	42
7.3.5	Radio-frequency (RF) survey procedure	43
7.3.6	The problem of radio-frequency interference	45
7.4	Seismic station site preparation, instrument installation and shielding	46
7.4.1	Introduction and general requirements (A. Trnkoczy)	46
7.4.2	Vault-type seismic stations (A. Trnkoczy)	47
7.4.2.1	Controlling environmental conditions	48
	• Mitigating temperature changes	48
	• Thermal tilt mitigation	53
	• Lightning protection	54
	• Electro-Magnetic Interference protection	55
	• Water protection	55
	• Protection from small animals	57
7.4.2.2	Contact with bedrock	57
7.4.2.3	Seismic soil-structure interaction and wind-generated noise	58
7.4.2.4	Other noise sources	58
7.4.2.5	Electrical grounding	59
7.4.2.6	Vault construction	61
7.4.2.7	Miscellaneous Hints	62
	• Vault cover design	62
	• Alternative materials	62
	• Mitigating vandalism	62
	• Fixing seismometers to the ground	62
7.4.3	Seismic installations in tunnels and mines (L. G. Holcomb)	63
7.4.4	Parameters which influence the very long-period performance of a seismological station: examples from the GEOFON Network (W. Hanka)	64
7.4.4.1	Introduction	64
7.4.4.2	Comparison of instrumentation and installation	65
	• Which seismometer to choose?	65
	• Installation of an STS1/VBB	66
	• Installation of an STS2	67
7.4.4.3	Comparison of vault constructions, depth of burial,	

geology and climate	68
• Tunnel vaults	68
• Shallow vaults	70
• Surface vaults in moderate climate	72
• Surface vaults in arctic climate	73
7.4.4.4 Conclusions	73
7.4.5 Broadband seismic installations in boreholes (L. G. Holcomb)	75
7.4.5.1 Introduction	75
7.4.5.2 Noise attenuation with depth	76
7.4.5.3 Site selection criteria	77
7.4.5.4 Contracting	78
7.4.5.5 Suggested borehole specifications	78
7.4.5.6 Instrument installation techniques	80
7.4.5.7 Typical borehole parameters	82
7.4.5.8 Commercial sources of borehole instruments	83
7.4.5.9 Instrument noise	84
7.4.5.10 Organizations with known noteworthy borehole experience	85
7.4.6 Borehole strong-motion array installation (R. L. Nigbor)	86
7.4.6.1 Introduction	87
7.4.6.2 Borehole array planning	89
• Location	89
• Geologic implications	91
• Coupling and retrievability issues	92
• Sensor orientation	92
• Systems issues	93
7.4.6.3 Borehole preparation	93
• Planning	93
• Selection of drilling contractor	95
• Permits	95
• Drilling	96
• Geotechnical sampling	97
• Casing	99
• Grouting	100
7.4.6.4 Geotechnical/Geophysical measurements	101
• Literature search	101
• Pre-installation geophysical studies	102
• Lithology logging	102
• Laboratory testing of soil samples	103
• Borehole geophysical measurements	103
7.4.6.5 Installation procedure	105
• Sensor installation	105
• Orientation	106
• Operational checkout	106
• Evaluation period	106
• Coupling/Locking	107
• Documentation/Reporting	107
7.4.6.6 Costs	107

Special references	108
Acknowledgments	108

CHAPTER 8: Seismic Networks (A. Trnkoczy, J. Havskov and L. Ottemöller)

8.1	Introduction	1
8.2	Seismic network purpose	2
8.3	Seismic sensors	3
	8.3.1 General considerations	3
	8.3.2 Seismometers and/or accelerometers?	3
	8.3.3 One- and three-component seismic stations	4
	8.3.4 Sensitivity of seismic sensors	4
	8.3.5 Frequency range of seismic sensors	5
	8.3.6 Short-period (SP) seismometers	6
	8.3.7 Broadband (BB) seismometers	7
	8.3.8 Very broadband (VBB) seismometers	7
	8.3.9 Long-period (LP) passive seismometers	7
8.4	Seismic network configuration	8
	8.4.1 Physical and virtual seismic networks	8
	8.4.2 Physical seismic networks	9
	8.4.2.1 Stand alone, central-recording, and network-based seismic systems	9
	8.4.2.2 Proprietary versus standardized off-the-shelf hardware solutions	10
	8.4.3 Virtual seismic networks	11
	8.4.3.1 General considerations	11
	8.4.3.2 Examples	12
	8.4.4 The choice between physical and virtual seismic systems	14
8.5	Seismic data acquisition	15
	8.5.1 Digital versus analog data acquisition	15
	8.5.1.1 Analog seismic systems	15
	8.5.1.2 Mixed analog/digital systems	15
	8.5.1.3 Digital seismic systems	16
	8.5.2 Trigger algorithms and their implementation	18
	8.5.2.1 Continuous versus triggered mode of data acquisition	18
	8.5.2.2 Trigger algorithm types	18
	8.5.2.3 Coincidence trigger principle	19
	8.5.2.4 Ring-buffer seismic systems	20
8.6	Seismic data transmission and network examples	20
	8.6.1 General considerations	20
	8.6.2 Types of physical data transmission links used in seismology	21
	8.6.3 Simplex versus duplex data transmission links	22
	8.6.4 Data transmission protocols and some examples of their use	22
	8.6.5 Compression of digital seismic data	25
	8.6.6 Error-correction methods used with seismic signals	26
	8.6.7 Seismic data transmission and timing	27
	8.6.8 Notes on dial-up phone lines and selection of modems	27
	8.6.9 Some network examples	28
	8.6.9.1 International Monitoring System (IMS)	28
	8.6.9.2 Southern California Seismic Network (SCSN)	29
	8.6.9.3 Japanese Seismic Networks (Hi-net, F-net and K-NET/KiK-net)	29

Contents Volume 1 & 2

8.6.9.4	German Regional Seismic Network (GRSN)	31
8.6.9.5	Norwegian National Seismic Network	32
8.7	Seismic shelters	33
8.7.1	Purpose of seismic shelters and lightning protection	33
8.7.2	Types of seismic shelters	34
8.7.3	Civil engineering works at vault seismic stations	34
8.8	Establishing and running a new physical seismic network	35
8.8.1	Planning and feasibility study	35
8.8.1.1	Goal setting	35
8.8.1.2	Financial reality	36
8.8.1.3	Basic system engineering parameters	39
8.8.1.4	Determining the layout of a physical seismic network	40
8.8.1.5	Number of stations in a physical seismic network	41
8.8.1.6	Laying out a new seismic network	41
8.8.2	Site selection	43
8.8.3	VHF, UHF and SS radio-link data transmission study	45
8.8.3.1	The need for a professional RF network design	45
8.8.3.2	Problems with RF interference	46
8.8.3.3	Organization of RF data transmission network design	46
8.8.4	Purchasing a physical seismic system	47
8.8.4.1	The bidding process	47
8.8.4.2	Selecting a vendor	48
8.8.4.3	Equipment selection	49
8.8.4.4	The seismic equipment market is small	50
8.8.5	System installation	50
8.8.5.1	Four ways of physical seismic system installation	50
8.8.5.2	Organization of civil engineering works	52
8.8.6	Running a physical seismic network	52
8.8.6.1	Tuning of physical seismic networks	52
8.8.6.2	Organizing routine operation tasks	54
8.8.6.3	System maintenance	55
8.8.6.4	Sensor calibration	56
8.8.6.5	Archiving seismic data	57
8.8.6.6	Dissemination of seismic data	58
	Acknowledgments	59
	Recommended overview readings	59

CHAPTER 9: Seismic Arrays (J. Schweitzer, J. Fyen, S. Mykkeltveit and T. Kvaerna)

9.1	Outline	1
9.2	Introduction	1
9.3	Examples of seismic arrays	3
9.4	Array beamforming	7
9.4.1	Geometrical parameters	9
9.4.2	Apparent velocity and slowness	11
9.4.3	Plane-wave time delays for sites in the same horizontal plane	13
9.4.4	Plane-wave time delays when including the elevation of sites	14
9.4.5	Beamforming	15

9.4.6	Examples of beamforming	17
9.5	Beamforming and detection processing	18
9.6	Array transfer function	23
9.7	Slowness estimation using seismic arrays	27
9.7.1	Slowness estimate by f-k analysis	27
9.7.2	Beampacking (time domain wavenumber analysis)	29
9.7.3	Slowness estimate by time picks	30
9.7.4	Time delay corrections	31
9.7.5	Slowness corrections	32
9.7.6	The correlation method used at the UKAEA arrays	33
9.7.7	The VESPA process	33
9.7.8	The n-th root process and weighted stack methods	35
9.8	Array design for the purpose of maximizing the SNR gain	36
9.8.1	The gain formula	36
9.8.2	Collection of correlation data during site surveys	37
9.8.3	Correlation curves derived from experimental data	38
9.8.4	Example: A possible design strategy for a 9-element array	39
9.9.	Routine processing of small-aperture array data at NORSAR	41
9.9.1	Introduction	41
9.9.2	Detection Processing – DP	44
9.9.3	Signal Attribute Processing – SAP	44
9.9.4	Event Processing – EP	48
9.10	Operational and planned seismic arrays	49
	Acknowledgments	51

CHAPTER 10: Seismic Data Formats, Archival and Exchange (B. Dost,
J. Zednik, J. Havskov, R. J. Willemann and P. Bormann)

10.1	Introduction (P. Bormann)	1
10.2	Parameter formats (J. Havskov, R. J. Willemann)	3
10.2.1	HYPO71	3
10.2.2	HPOINVERSE	4
10.2.3	Nordic format	4
10.2.4	The GMS/IMS formats	5
10.2.5	The IASPEI Seismic Format (ISF)	6
10.3	Digital waveform data	6
10.3.1	Data archival	8
10.3.2	Data exchange formats	9
10.3.3	Formats for data base systems	10
10.3.4	Continuous data protocols and formats	10
10.4	Some commonly encountered digital data formats	11
10.5	Format conversions	17
10.5.1	Why convert?	17
10.5.2	Ways to convert	17

CHAPTER 11: Data Analysis and Seismogram Interpretation

(P. Bormann, K. Klinge and S. Wendt)

11.1	Introduction	1
11.2	Criteria and parameters for routine seismogram analysis	7
11.2.1	Record duration and dispersion	7
11.2.2	Key parameters: Onset time, amplitude, period and polarity	7
11.2.3	Advanced wavelet parameter reporting from digital records	11
11.2.4	Criteria to be used for phase identification	12
11.2.4.1	Travel time and slowness	12
11.2.4.2	Amplitudes, dominating periods and waveforms	14
11.2.4.3	Polarization	19
11.2.4.4	Example for documenting and reporting of seismogram parameter readings	22
11.2.5	Criteria to be used in event identification and discrimination	24
11.2.5.1	Discrimination between shallow and deep earthquakes	24
11.2.5.2	Discrimination between natural earthquakes and man-made seismic events	28
11.2.6	Quick event identification and location by means of single-station three-component recordings	32
11.2.6.1	What is the best way of analyzing three-component seismograms?	32
11.2.6.2	Hypocenter location	34
11.2.7	Magnitude determination	38
11.2.8	Hypocenter location by means of network and array recordings	39
11.3	Routine signal processing of digital seismograms	39
11.3.1	Signal detection	39
11.3.2	Signal filtering, restitution and simulation	40
11.3.3	Signal coherency at networks and arrays	51
11.3.4	f-k and vespagram analysis	52
11.3.5	Beamforming	56
11.3.6	Polarization analysis	57
11.4	Software for routine analysis	58
11.4.1	SHM	58
11.4.2	SEISAN	60
11.4.3	PITSA	60
11.4.4	GIANT	60
11.4.5	Other programs and ORFEUS software links	60
11.5	Examples of seismogram analysis	61
11.5.1	Seismograms from near sources ($0^\circ < D \leq 15^\circ$)	63
11.5.2	Teleseismic earthquakes ($15^\circ < D < 180^\circ$)	72
11.5.2.1	Distance range $15^\circ < D \leq 28^\circ$	72
11.5.2.2	Distance range $28^\circ < D \leq 100^\circ$	75
11.5.2.3	Distance range $100^\circ < D \leq 144^\circ$	80
11.5.2.4	Core distance range beyond 144°	87
11.5.3	Late and very late core phases	89
11.5.4	Final remarks on the recording and analysis of teleseismic events	99
	Acknowledgments	100
	Recommended overview readings	100

CHAPTER 12: Intensity and Intensity Scales (R. M. W. Musson)

12.1	Intensity and the history of intensity scales	1
12.1.1	European Macroseismic Scale (EMS)	2
12.1.2	Modified Mercalli (MM) Scale	4
12.1.3	Accuracy of assessment	5
12.1.4	Equivalence between scales	6
12.2	Collection of macroseismic data	7
12.2.1	Macroseismic questionnaires	7
12.2.2	Field investigations	10
12.3	Processing of macroseismic data	11
12.3.1	Assessing intensity from data	11
12.3.2	Isoseismal maps	12
12.3.2.1	Example of an isoseismal map	15
12.3.3	Determination of earthquake parameters from macroseismic data	16
12.3.3.1	Macroseismic epicenter	16
12.3.3.2	Epicentral intensity	16
12.3.3.3	Macroseismic magnitude	17
12.3.3.4	Estimation of focal depth	18
12.3.4	Intensity attenuation	19
12.3.5	Relationship with ground motion parameters	20
	Acknowledgments	20
	Recommended overview readings	20

CHAPTER 13: Volcano Seismology (J. Wassermann)

13.1	Introduction	1
13.1.1	Why a different chapter?	2
13.1.2	Why use seismology when forecasting volcanic eruptions?	2
13.2	Classification and source models of volcano-seismic signals	3
13.2.1	Transient volcano-seismic signals	3
13.2.1.1	Volcanic-Tectonic events (deep and shallow)	3
13.2.1.2	Low-Frequency Events	5
13.2.1.3	Hybrid events, Multi-Phases events	6
13.2.1.4	Explosion quakes, very-low-frequency events, ultra-low-frequency events	7
13.2.2	Continuous volcanic-seismic signals	11
13.2.2.1	Volcanic tremor (low-viscous two-phase flow and eruption tremor)	11
13.2.2.2	Volcanic tremor (high-viscous - resonating gas phase)	13
13.2.2.3	Surface processes	15
13.2.3	Special note on noise	17
13.3	Design of a monitoring network	18
13.3.1	Station site selection	18
13.3.2	Station distribution	18
13.3.3	Seismic arrays in volcano monitoring	19
13.3.4	Network of seismic arrays	19
13.4	Analysis and interpretation	21
13.4.1	One-component single station	21
13.4.1.1	Spectral analysis	22

Contents Volume 1 & 2

13.4.1.2 Envelope, RSAM and cumulative amplitude measurements	23
13.4.2 Three-component single station	26
13.4.2.1 Polarization	26
13.4.2.2 Polarization filters	26
13.4.3 Network	28
13.4.3.1 Hypocenter determination by travel-time differences	28
13.4.3.2 Amplitude - distance curves	30
13.4.4 Seismic arrays	31
13.4.4.1 f-k beamforming	31
13.4.4.2 Array polarization	33
13.4.4.3 Hypocenter determination using seismic arrays	33
13.4.4.4 Classification problem using seismic arrays	34
13.4.5 Automatic analysis	34
13.5 Other monitoring techniques	35
13.5.1 Ground deformation	35
13.5.2 Micro-Gravimetry	36
13.5.3 Gas monitoring	37
13.5.4 Meteorological parameters	38
13.6 Technical considerations	38
13.6.1 Site	38
13.6.2 Sensors and digitizers	39
13.6.3 Analog versus digital telemetry	40
13.6.4 Power considerations	41
13.6.5 Data center	41
Acknowledgments	42
Recommended overview readings	42

ANNEXES

List of contents Volume 2 xxxi

Datasheets	number of pages
• DS 2.1 Global 1-D Earth Models (P. Bormann)	12
• DS 3.1 Magnitude calibration functions and complementary data (P. Bormann)	8
• DS 5.1 Common seismic sensors (E. Wielandt)	10
• DS 11.1 Additional local and regional seismogram examples (K. Klinge)	14
• DS 11.2 Additional seismogram examples in the distance range 13°-100° (K. Klinge)	44
• DS 11.3 Additional seismogram examples at distances beyond 100° (K. Klinge, S. Wendt, P. Bormann)	24
• DS 11.4 Record examples of underground nuclear explosions (K. Klinge, J. Schweitzer, P. Bormann)	6

Exercises

• EX 3.1	Magnitude determinations (P. Bormann)	8
• EX 3.2	Determination of fault plane solutions (M. Baumbach †, P. Bormann)	8
• EX 3.3	Take-off angle calculations for fault plane solutions and reconstruction of nodal planes from the parameters of fault-plane solutions (P. Bormann)	6
• EX 3.4	Determination of source parameters from seismic spectra (M. Baumbach †, P. Bormann)	6
• EX 3.5	Moment tensor determination and decomposition (F. Krüger, G. Bock †)	4
• EX 4.1	Bandwidth-dependent transformation of noise data from frequency into time domain and vice versa (P. Bormann, E. Wielandt)	8
• EX 5.1	Plotting seismograph response (BODE-diagram) (J. Bribach)	4
• EX 5.2	Estimating seismometer parameters by step function (STEP) (J. Bribach)	6
• EX 5.3	Seismometer calibration by harmonic drive (J. Bribach, Ch. Teupser†)	2
• EX 5.4	Seismometer calibration with program CALEX (E. Wielandt)	4
• EX 5.5	Determination of seismograph response from poles and zeros (E. Wielandt)	8
• EX 11.1	Estimating the epicenters of local and regional seismic sources by hand, using the circle and chord method (P. Bormann, K. Wylegalla)	8
• EX 11.2	Earthquake location at teleseismic distances by hand from 3-component records (P. Bormann, K. Wylegalla)	10
• EX 11.3	Identification and analysis of short-period core phases (S. Wendt, P. Bormann)	16

Information Sheets

• IS 2.1	Standard nomenclature of seismic phases (D. A. Storchak, P. Bormann, J. Schweitzer)	18
• IS 3.1	Theoretical source representation (H. Grosser, P. Bormann, A. Udias)	20
• IS 3.2	Proposal for unique magnitude nomenclature (P. Bormann)	6
• IS 5.1	Strainmeters (W. Zürn)	8
• IS 5.2	Constructing response curves: Introduction to the BODE-diagram (J. Bribach)	6
• IS 7.1	What to prepare and provide if seismic site selection is purchased? (A. Trnkoczy)	2
• IS 7.2	Using existing communication tower sites as seismic sites (A. Trnkoczy)	2
• IS 7.3	Recommended minimal distances of seismic sites from sources of seismic noise (A. Trnkoczy)	2
• IS 7.4	Detectability and earthquake location accuracy modeling of seismic networks (M. Živčić, J. Ravnik)	4
• IS 8.1	Understanding and parameter setting of STA/LTA trigger algorithm (A. Trnkoczy)	20
• IS 8.2	Seismic data transmission links used in seismology in brief (A. Trnkoczy)	4
• IS 8.3	Retrieving data from IRIS/USGS stations (C. Peterson)	8
• IS 10.1	Data-Type Bulletin IMS1.0: Short (R. J. Willemann)	8
• IS 10.2	Example of station parameter reports grouped according IMS1.0 with ISF1.0 extensions (R. J. Willemann)	6
• IS 10.3	Access to the CMR seismic/hydroacoustic/infrasonic data (X. Yang, R. North)	16
• IS 11.1	Earthquake location (J. Havskov, P. Bormann, J. Schweitzer)	28

Contents Volume 1 & 2

- IS 11.2 Reports and bulletins (G. Hartmann) 2
- IS 11.3 Animation of seismic ray propagation and seismogram formation (S. Wendt, U. Starke, P. Bormann) 6

Program Descriptions

- PD 4.1 NOISECON (E. Wielandt) 2
- PD 5.1 CALIBRAT (J. Bribach) 2
- PD 5.2 CALEX (E. Wielandt) 4
- PD 5.3 DISPCAL (E. Wielandt) 2
- PD 5.4 DISPCAL1 (E. Wielandt) 2
- PD 5.5 TILTCAL (E. Wielandt) 2
- PD 5.6 SINFIT (E. Wielandt) 2
- PD 5.7 UNICROSP (E. Wielandt) 2
- PD 5.8 POL_ZERO (E. Wielandt) 2
- PD 5.9 WINPLOT (E. Wielandt) 2
- PD 11.1 HYPOSAT/HYPOMOD (J. Schweitzer) 16
- PD 11.2 LAUFZE/LAUFPS (J. Schweitzer) 14
