## Vorwort

Da Abschätzungen zur Seismizität, zur seismischen Gefährdung und zum seismischen Risiko bestenfalls so gut sein können, wie die Erdbebentätigkeit der Vergangenheit bekannt ist, wurde in den letzten ca. 10 Jahren intensiv an der Verbesserung der hierfür notwendigen Datenbasis, d. h. am Erdbebenkatalog, gearbeitet. Hierzu wurden sowohl Angaben aus bekannten Quellen neu bewertet als auch nicht berücksichtigte Quellen für die Auswertung erschlossen.

Zum gegenwärtigen Zeitpunkt liegen die Daten bis einschließlich des Jahres 1984 vollständig katalogisiert vor. Zum Beben-schwarm im Herdgebiet Vogtland/West-Böhmen in den Jahren 1985 und 1986 war die Bearbeitung bei Abschluß der Arbeiten zum vorliegenden Katalog im April 1987 noch nicht beendet.

Der vorliegende Erdbebenkatalog dokumentiert den gegenwärtigen Stand der Katalogbearbeitung in komprimierter Form anhand des ausgedruckten Katalog-Computer-Files. Es ist klar, daß eine effektive Bearbeitung der Daten nur mittels elektronischer Datenverarbeitung möglich ist, wozu Interessenten entsprechende Magnetband-Kopien anfordern können.

Einer überblicksmäßigen Information zur Seismizität des katalogisierten Gebietes dient die beigelegte Epizentrenkarte. Ansonsten wird im Textteil auf weiterführende Arbeiten zur Seismizität, seismischen Gefährdung und Seismotektonik hingewiesen.

Dieser Katalog-Abdruck kann nur einen Bruchteil der Informationen wiedergeben, die insbesondere zu zahlreichen stärkeren Beben vorliegen. Es würde jedoch völlig den Rahmen der vorliegenden Publikation sprengen, diese Informationsfülle gemeinsam mit dem kompletten Bebenkatalog dokumentieren zu wollen. Vielmehr sind zum Katalog spezielle ergänzende, für die Zukunft geplante Veröffentlichungen vorgesehen. Gleichfalls gestattet es die Art der Präsentation des Katalogs nicht, wie es für zahlreiche Daten wünschenswert wäre, in verbaler Form Einschränkungen zur Güte einiger Parameter zu machen. Es können nur Werte zur Fehlerabschätzung gegeben werden.

Die Erfahrung der letzten Jahre zeigt, daß zu den historischen Beben stets neue Materialien aufgefunden werden, die eine weitere Präzisierung der Daten und Vervollständigung des Katalogs ermöglichen. Gleichfalls kann nicht ausgeschlossen werden, daß sich Datenfehler in den Katalog-File eingeschlichen haben. Bei Vorliegen sicherer neuer Informationen wird der Computer-File regelmäßig aktualisiert. Leser oder Nutzer des Katalogs werden gebeten, Korrekturen oder Ergänzungen dem Autor mitzuteilen.

## P r e f a c e

As the assessment of seismicity, of seismic hazard and seismic risk can best be as good as earthquake activities of the past are known, intensive work auf the last 10 years has been dedicated to the improvement of the necessary data basis, i. e. the earthquake catalogue. For this purpose both data from previous catalogues were reevaluated and so far not considered sources included.

All currently available data have been catalogued until the end of 1984. The analysis of the more recent earthquake swarm in the focal zone Vogtland/West Bohemia (1985/86) was not yet completed at the deadline of this manuscript and could, therefore, not be considered for this catalogue.

The present earthquake catalogue documents the state of the art of catalogueing in a comprised manner in form of a print-out of a computer file.

It is quite obvious that an effective data analysis is only possible by means of electronic data processing. Prospective users may, therefore, receive on request copies of the catalogue on magnetic tape.

The attached epicentre map represents an overview of seismicity for the catalogued area. In the text reference is made to more detailed papers on seismicity, seismic hazard and seismotectonics.

This catalogue can reflect only a small part of information available especially for the numerous stronger quakes. Any attempt to document the abundance of information together with the attached complete catalogue of earthquakes would, however, go entirely beyond the scope of this publication. The catalogue has, therefore, to be complemented by special supplementary publications planned for the future. Moreover, this kind of presentation of the catalogue does not allow for verbal qualifying remarks on the fidelity of some parameters which, however, would be desirable for quite a number of data. Only values of error evaluations for the main parameters can be given in the catalogue.

Experience of recent years shows that also in the future additional and new material about historic earthquakes might be found which would enable further improvement of data and completion of the catalogue. It cannot, either, be excluded that data errors have crept into the catalogue. However, if new reliable information is available, the computer file will be updated regularly. Readers and users of the catalogue are kindly requested to contact the author in case of necessary corrections or supplements.

Potsdam, im Juni 1987

Potsdam, June 1987

## 1. Einführung

Grundlage jeglicher Untersuchungen zur Seismizität eines Gebietes, des seismischen Regimes, der seismischen Gefährdung oder gar der Erdbebenvorhersage ist ein möglichst vollständiger, möglichst weit in die Historie zurückreichender, möglichst homogener Erdbebenkatalog des zu untersuchenden Areals. Dabei genügt es nicht, vorliegende Kataloge durch neue Erdbeben zu ergänzen. Es ist insbesondere in Gebieten schwacher seismischer Aktivität wichtig, frühere bzw. historische Beobachtungen zu Erdbeben nach Möglichkeit durch zusätzliche unabhängige Informationen zu vervollständigen, um so letztlich präzisere Angaben zum Herdort und zur Bebenstärke zu erhalten. Beim Quellenstudium finden sich mitunter auch Hinweise auf Beben, die in bisherigen Katalogen nicht enthalten sind. Somit gestalten sich Revisionen und Komplettierungen von Bebenkatalogen sowie die daraus abzuleitenden Seismizitätsuntersuchungen zu einem kontinuierlichen Prozeß.

Der vorliegende Bebenkatalog stellt eine grundlegend überarbeitete Seismizitätsdatenbasis für das Territorium der DDR einschließlich angrenzender Gebiete dar. Er umfaßt den Zeitraum von den Anfängen schriftlicher Aufzeichnungen im genannten Gebiet bis zum Ende des Jahres 1984.

## 2. Bisherige Erdbebenkataloge des Untersuchungsgebietes

Der Wert historischer Erdbebendaten ist zweifellos unbestritten (AMBRASEYS, 1971). In Mitteleuropa zeugen - gemessen an der Seltenheit von Erdbeben - ab dem 16. Jahrhundert relativ zahlreiche Schriften über diese Naturerscheinung vom regen Interesse, das den Erdbeben entgegengebracht worden ist.

Andererseits sind diese Schriften Ausdruck des Entwicklungsstandes der Produktivkräfte. Zum einen war es die Entwicklung der Drucktechnik, die die Verbreitung dieser BebenNachrichten ermöglichte, zum anderen aber, insbesonders in Sachsen, die Entwicklung des Bergbaus, durch den eine zunehmend systematische Sammlung von BebenNachrichten gefördert wurde. Des Weiteren ist nicht zu unterschätzen, daß viele derartige Sammlungen oder Flugschriften "denkwürdiger Naturerscheinungen" eine bereits im 16. Jahrhundert begehrte Sensationspostille darstellten (siehe z. B. DERESIEWICZ, 1982).

Verbunden mit der Aufklärung ging in den letzten Jahrzehnten des 18. Jahrhunderts bzw. zu Beginn des 19. Jahrhunderts eine spürbare Entmystifizierung der Berichte über Erdbeben einher. Derartige sachliche und z. T. recht detaillierte Schilderungen könnte man als die ersten seismologischen Arbeiten in Mitteleuropa ansehen (z. B. JÄHRING, 1789 (siehe bei SCHMIDT, 1973); ANONYM, 1821a; EGEN, 1828).

Entsprechend zahlreich sind solche Abhandlungen über makroseismische Wirkungen einzelner Beben im sächsisch-thüringischen Raum in der zweiten Hälfte des 19. Jahrhun-

derts - verbunden mit einem allgemeinen Anwachsen der seismischen Aktivität in dieser Zeit. Beispielsweise seien hier genannt: GIEBEL (1857), CREDNER (1876, 1877, 1889) v. SEEBACH (1873), BELAR (1899). Ausführliche Quellenverzeichnisse hierzu geben KÄRNİK et al. (1957) sowie SCHMIDT u. SCHMIDT (1972).

Zu den ältesten Erdbebenkatalogen, die besonders die Beben des ehemaligen Landes Sachsen sowie der Thüringischen Staaten berücksichtigen, zählen die Erdbeben-Chroniken von REICH (1839), HOFF (1840, 1841) sowie von EISEL (1863). Die umfassendste Sammlung historischer Quellen der Beben Mitteleuropas (aber auch mit Bezug zur globalen Seismizität), auf die in späteren Katalogen weitestgehend zurückgegriffen wird, ist der handschriftliche neunzehnbändige Bebenkatalog von LERSCH, endend mit 1897.

"Welche Bedeutung diesem Katalog in Fachkreisen beigemessen wird, zeigt am besten das Schreiben, welches die I. internationale seismologische Konferenz an Herrn Dr. Lersch richtete, nachdem der Direktor des Aachener meteorologischen Observatoriums, Herr Dr. P. Polis, der Versammlung einen Teil dieses Werkes vorgelegt hatte. Der Wortlaut dieses hochbedeutsamen Schreibens lautet folgendermaßen:

Hochgeehrter Herr Doktor!  
Die seismologische Konferenz hat durch Herrn Dr. Polis den Einblick in den mit so außerordentlicher Hingabe und Sachkunde ausgearbeiteten Erdbebenkatalog erhalten, der einen wesentlichen Teil der Arbeit eines langen und reichen Lebens darstellt. Über den großen Nutzen, den ein solches, direkt auf den Quellen fußendes Verzeichnis aller jemals in die Erscheinung getretenen Erschütterungen der Forschung gewähren muß, waren sich die Versammelten einig, und es wurde nur das lebhafte Bedauern ausgedrückt, daß ein Abdruck des wertvollen Manuskriptes in extenso doch wohl wegen der hohen zu erfordernden Mittel in absehbarer Zeit nicht zu erhoffen sein möchte. Der Wunsch der Konferenzmitglieder, das ungeheure, durch Ihren Fleiß angesammelte Material der Wissenschaft nutzbar zu machen, ist jedoch ein höchst dringender, und deshalb geht unsere Bitte an Sie dahin, gestatten zu wollen, daß Ihre handschriftliche Sammlung der kaiserlichen Hauptstation für Erdbebenforschung zu Straßburg i. E. - vorbehaltlich aller Eigentumsrechte des Autors - einstweilen überlassen werde, um bei der in Aussicht genommenen Herstellung eines den Grundsätzen der neueren seismischen Forschung angepaßten Erdbebenkataloges als höchst wertvolle Unterlage und Stütze zu dienen.

Genehmigen Sie, hochverehrter Herr, den Ausdruck der vorzüglichsten Hochachtung,

Die internationale seismologische Konferenz."  
(aus POLIS, 1902).

Zum wesentlichen Teil auf den LERSCH-Katalog fußend, stellte SIEBERG (1940) den "... Erdbebenkatalog Deutschlands und angrenzender Gebiete für die Jahre 58 - 1799"

zusammen; sowie als Fortsetzung SPONHEUER (1952) den "Erdbebenkatalog Deutschlands und der angrenzenden Gebiete für die Jahre 1800 - 1899". Beide Kataloge machen die von LERSCH gesammelten Daten, ergänzt durch weiteres Material, einem breiteren Nutzerkreis zugänglich. Nahezu alle Beben Deutschlands, die LERSCH erwähnt, dürften in diese Kataloge eingegangen sein (SPONHEUER, pers. Mitteilung).

Bemerkenswert im Vergleich mit sonstigen Katalogen ist allerdings die große zeitliche Lücke zwischen dem Ende des katalogisierten Zeitraumes und dem Veröffentlichungsjahr dieser Kataloge. Ein Grund hierfür ist zweifelsohne die außerordentlich starke seismische Aktivität in Sachsen, Ost-Thüringen und im Vogtland, beginnend in der Mitte des 19. Jahrhunderts bis zum Ende des 1. Jahrzehnts des 20. Jahrhunderts mit dem Schwerpunkt der Aktivität im Vogtland in den Jahren 1903 und 1908. Dieser Barrierre eines äußerst umfangreichen makroseismischen wie inzwischen auch instrumentellen Datenmaterials stellten sich KUNZE sowie SPONHEUER in zäher, mühevoller sowie mit großem Fleiß ausgeführter Arbeit.

Die entscheidende Grundlage für die uns heute so zahlreich vorliegenden Informationen insbesondere zu sächsischen Beben von 1875 bis 1910 hat CREDNER gelegt. CREDNER, seit 1872 Direktor der Geologischen Landesuntersuchung von Sachsen, begann 1875, Daten über die Erdbeben Sachsen zu sammeln und auszuwerten (SCHMIDT, 1974). Die zunehmende Intensität, mit der er diese Arbeiten ausführte, war zweifelsohne gepaart mit der bereits erwähnten zunehmenden Bebenaktivität im sächsisch-thüringischen Raum. Einen ersten Höhepunkt erreichte sie mit dem für die Region bemerkenswert starken Beben vom 6. März 1872 (SPONHEUER u. GRÜNTHAL, 1981). Dann konzentrierte sich die Aktivität im Vogtland mit Aktivitätsmaxima in den Jahren 1897, 1903 und 1908. Der Bebenschwarm im Jahre 1897 mag CREDNER maßgeblich veranlaßt haben, 1898 eine Erdbebenkommission einzurichten. Sie bestand aus "55 gebildeten Männern", welche beauftragt waren, "als Erdbebenreferenten über alle in ihrer Gegend sich äußernden Erderschütterungen auf Grund eines Fragebogens möglichst vielseitige Erkundigungen einzuziehen und über deren Resultate umgehend Bericht an die Zentralstelle in Leipzig zu erstatten." Gleichzeitig konnte CREDNER von der Königlichen Generaldirektion der Sächsischen Staatseisenbahnen eine Verordnung erwirken, wonach alle Eisenbahnstationen, an denen eine Erderschütterung bemerkt worden war, verpflichtet waren, sofort telegraphisch Nachricht nach Leipzig zu geben (CREDNER u. ETZOLD, 1909). Wesentliche wissenschaftliche Ergebnisse, die auf der Tätigkeit der Erdbebenkommission beruhen, sind die makroseismischen Informationen in den Abhandlungen über den vogtländischen Bebenschwarm vom 13. Februar bis 18. Mai 1903 (CREDNER, 1904) sowie über "Die in Sachsen von 1907 bis 1915 gefühlten Erderschütterungen" (ETZOLD, 1919).

Mit dem Abbeben der seismischen Aktivität im Vogtland sowie dem Eintritt CREDNERs in

den Ruhestand kam die Tätigkeit der Erdbebenkommission um 1909/1910 zum Erliegen. Es ist zu bedauern, daß die von beiden Autoren erwähnten Sammlungen der originalen Bebenbeobachtungen verlorengegangen sind und dadurch der modernen Erforschung der Seismizität nicht mehr zur Verfügung stehen. Glücklicherweise liegen, beginnend mit dem Greizer Erdbeben vom 1. Mai 1902 - dem ersten registrierten Nahbeben an der Erdbebenwarte Leipzig - die sorgfältigen instrumentellen Auswertungen der stärkeren Stöße zur Magnitudenbestimmung vor (fast alle Originalregistrierungen sind bei der Zerstörung des Leipziger Geophysikalischen Instituts 1943 vernichtet worden (MEYER, 1981)). Vogtland-Beben der Maximalintensität von 4° wurden gerade noch auswertbar registriert.

Leider wurde die Auswertung der Leipziger Registrierungen des Bebenschwarms 1908 nicht so konsequent weitergeführt. Dafür stehen zur Magnitudenbewertung dieser Beben neben den Jenaer Registrierungen die lückenlosen Aufzeichnungen des Göttinger 17-t-Pendels zur Verfügung.

Aus der jüngeren Vergangenheit sind es folgende Kataloge, die Angaben zur Vogtlandaktivität enthalten (KÁRNÍK et al., 1957; SCHMIDT, 1969; SCHENKOVÁ, 1976).

Hierauf konnten sich SPONHEUER und KUNZE zwar stützen - aber beim wechselseitigen Vergleich der verschiedenen Quellen, einschließlich der instrumentellen Daten, tauchten Ungenauigkeiten und Fehler in Datierungen, Orts- und Stärkeangaben auf; z. B. wurden von SPONHEUER und KUNZE aufgrund der Zeitunsicherheiten vor Einführung des Rundfunks die von verschiedenen Verfassern angegebenen Einzelstöße kritisch untersucht, ob sie nicht zu einem größeren Erdbeben gehören, wenn die Zeitunterschiede innerhalb des möglichen Schwankungsbereiches der Zeitangaben liegen. In vielen Fällen ergaben sich hierbei durch Zusammenfassen von scheinbaren Einzelbeben sinnvolle und wahrscheinliche Schüttergebiete. Dieses Prinzip wurde vom Autor bei der grundlegenden weiteren Überarbeitung fortgesetzt. Genauere Festlegungen der Uhrzeit waren immer dann möglich, wenn das jeweilige Beben von einer Erdbebenstation registriert wurde oder die Uhrzeit nach den für die damalige Zeit bemerkenswert genau bzw. synchron gehenden Uhren der Eisenbahn bestimmt werden konnte. Die Klärung solcher und anderer Unstimmigkeiten in den o. g. Quellen verzögerten immer wieder eine Fertigstellung des Kataloges (KUNZE, pers. Mitteilung).

SPONHEUER und KUNZE beschränkten sich nicht auf die Vogtlandbeben, sondern bearbeiteten die gesamte Bebentätigkeit des Territoriums der DDR sowie der unmittelbar angrenzenden Gebiete. KUNZE konzentrierte sich auf den Zeitraum von 1900 - 1926. Neben der makroseismischen Datensammlung fertigte er Isoseistenkarten von den stärkeren Beben. SPONHEUER bearbeitete den Zeitraum von 1927 bis 1975 und besorgte generell die Auswertung der instrumentellen Aufzeichnungen, berechnete Magnituden sowie Herdtiefen. Textteile des Kataloges redigierten sie gemeinsam, desweiteren die Bestimmung

von Epizentralintensitäten. Der Katalogteil von 1900 - 1926 ist, abgesehen von Isoseistkarten, ähnlich dem von KÁRNÍK et al. (1957) gestaltet, d. h. Angabe des Datums sowie der Ortschaften makroseismischer Beobachtungen größtenteils unter Nennung der jeweiligen Intensitätswerte. Ungefährte Koordinaten werden sporadisch in der Regel nur anhand vorliegender Isoseistkarten genannt. Des Weiteren enthält das Katalog-Manuskript die Beben mit Herden außerhalb des Untersuchungsgebietes, sofern sie auf dem Territorium der DDR makroseismisch spürbar werden. Der Katalogteil von 1927 - 1975 nach SPONHEUER liegt nur fragmentarisch vor. Beiden Kollegen war es leider nicht vergönnt, ihre über viele Jahre durchgeführten Katalog-Arbeiten zum Abschluß zu bringen. Bis zuletzt haben beide immer wieder Neufassungen einzelner Katalogteile sowie die Interpretation einzelner Beben erarbeitet. Beispielsweise hat KUNZE die bei PROCHÁZKOVA und KÁRNÍK (1978) veröffentlichten Isoseistkarten von Vogtlandbeben nach KUNZE u. PROCHÁZKOVA durch eine Vielzahl weiterer makroseismischer Daten ergänzen und teilweise grundlegend überarbeiten können. Die im wissenschaftlichen Nachlaß von SPONHEUER und KUNZE enthaltenen - teils maschinen-, teils handschriftlichen - Katalog-Unterlagen werden im Sinne beider Bearbeiter im folgenden zitiert als SPONHEUER und KUNZE (1981).

Während des Vogtland-Bebenschwames im Jahre 1962 wurde vom damaligen Institut für Geodynamik Jena ein lokales Stationsnetz installiert, welches in späteren Jahren einige Modifizierungen erhielt. Einen Katalog der instrumentellen Auswertungen der Vogtland-Beben von August 1962 bis Juni 1981 legten NEUNHÖFER u. GÜTH (1982) vor sowie die Ergänzungen bis 1984 (NEUNHÖFER u. GÜTH, 1984, 1985a, b).

Seit etwa 1975 gewann die möglichst zuverlässige Einschätzung aller stärkeren Beben im Zusammenhang mit Gefährdungsabschätzungen zunehmend an Bedeutung. In Gebieten mit weit in die Historie zurückreichenden Beobachtungen ist die Mehrzahl solcher Beben in der Regel historischer Art, d. h. vor 1900 aufgetreten. Die zu solchen historischen Beben im Untersuchungsgebiet aufgestellten Recherchen führten innerhalb der letzten Jahre zu Erkenntnissen, die z. T. weit darüber hinausgehen, was in den Katalogen von SIEBERG (1940) und SPONHEUER (1952) angegeben ist. Diese Untersuchungen blieben allerdings bis auf wenige Ausnahmen unveröffentlicht (z. B. SPONHEUER u. GRÜNTHAL (1981) zum Mitteldeutschen Erdbeben von 1872, STEINWACHS (1983) zum Lüneburger Erdbeben von 1323). Relativ gute Kenntnis konnte beispielsweise auch zum Beben von 1410 in der Prignitz gewonnen werden.

Im vorliegenden Katalog wurden die Daten von vor 1900 vom Autor zusammengetragen bzw. neu eingeschätzt, wenn möglich, makroseismische Karten entworfen und die Herdpараметer (Ort und Stärke) ermittelt. Die Daten von 1900 - 1961 gehen größtenteils auf das Manuskript von SPONHEUER und KUNZE (1981) zurück. Sofern genügend makroseismische Informationen zu einzelnen Beben zu-

sammengestellt werden konnten, wurden hieraus ebenfalls makroseismische Karten erstellt und daraus vom Autor die Herdpараметer einschließlich Herdtiefe abgeleitet.

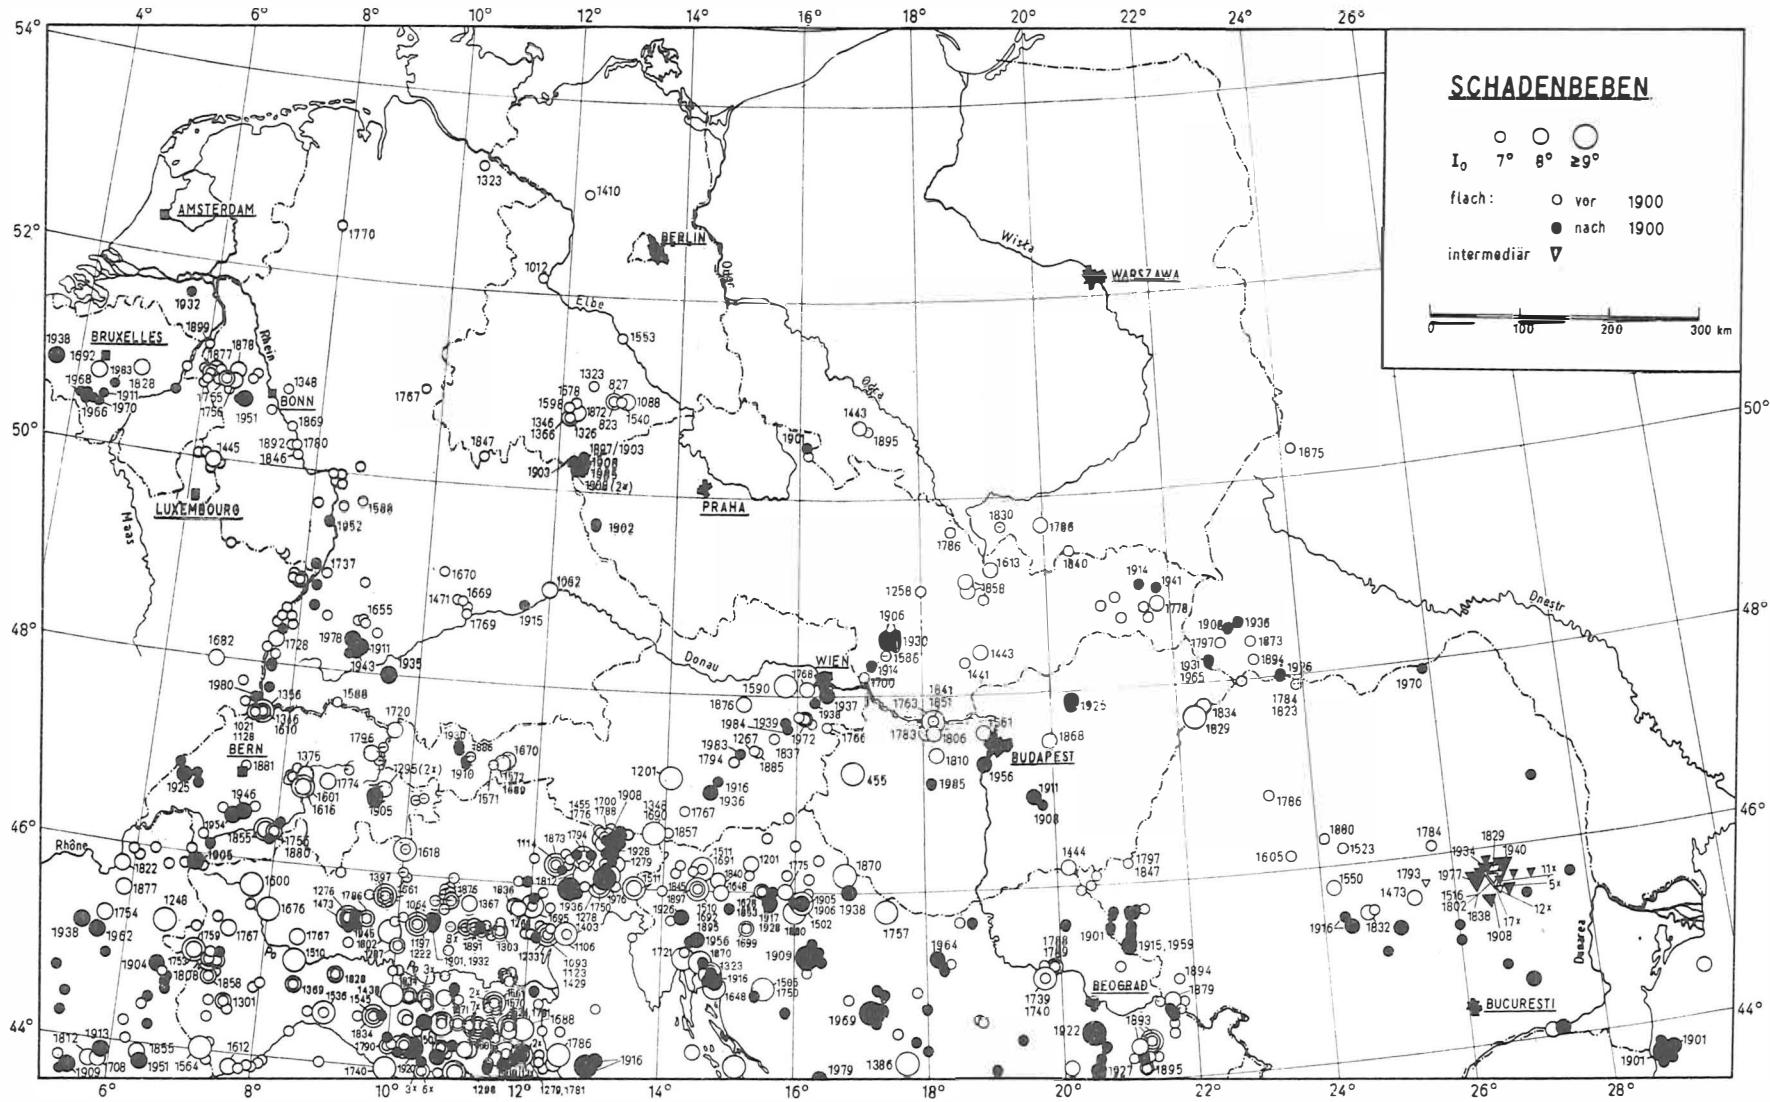

Seit Installation des lokalen Bebenetzes im Vogtland im Jahre 1962 dominieren im Katalog instrumentelle Daten nach NEUNHÖFER und GÜTH (1982, 1984). Hieraus wurden jene Beben in den Katalog aufgenommen, deren Stärkeklassifizierung vorlag. Für Beben ohne instrumentelles Ortungsergebnis, aber mit vorliegender Magnitude wurde ein wahrscheinlicher Herd im Zentrum des Schwarmgebietes angenommen, aber mit einem entsprechend großen Lokalisationsfehler von +-15 km (siehe 3.2.; Punkt 4).

### 3. Konzeption des Erdbebenkatalogs

#### 3.1. Abgrenzung des katalogisierten Gebietes

Da Erdbebenkataloge die Grundlage jeglicher Untersuchungen zur Seismizität und seismischen Gefährdung sind und hierbei nicht nur das unmittelbar einzuschätzende Territorium einzubeziehen ist, kommt einer optimalen Umgrenzung des zu katalogisierenden Gebietes eine nicht unwesentliche Bedeutung zu. Für seismische Gefährdungsabschätzungen sind alle Erdbeben-Herdregionen bei der Analyse zu berücksichtigen, die auf dem einzuschätzenden Territorium signifikante Erschütterungsintensitäten (i.d.R.  $\geq 4^\circ$ ) hervorrufen können, d. h., für Einschätzungen von Standorten in der DDR ist von einer Betrachtung der Seismizität Mitteleuropas i.w.S. auszugehen. Gleichfalls sind seismotektonische Einheiten als solche zu behandeln, auch wenn sie grenzüberschreitend sind. Unter Mitteleuropa i.w.S. wird hier ein Gebiet verstanden, von dem eine prinzipielle makroseismische Beeinflussung des Territoriums der DDR erwartet werden könnte, bzw. wurde es so gewählt, daß es den markanten tektonischen Komplex des Alpen-Karpaten-Bogens umfaßt.

Der in Abb. 1 dargestellten Karte der Schabenbeben Mitteleuropas (d. h. Beben mit maximalen Intensitäten  $\geq 6,5-7^\circ$ ) liegen neben der vorliegenden Veröffentlichung im wesentlichen Angaben aus folgenden Quellen zugrunde: CARROZZO et al. (1973), IACCARINO (1973), KÁRNÍK et al. (1981), LEYDECKER und HARJES (1978), SÄGESSEMER und MAYER-ROSA (1978), SCHNEIDER (1968), SHEBALIN et al. (1974), WEBER (1980) sowie einige aktuelle Bebenkataloge (z. B. für Belgien) hinsichtlich verschiedener Ergänzungen. Halbe Intensitätsgrade werden in der Darstellung nicht unterschieden, d. h., maximale Intensitäten von z. B.  $6,5^\circ$  erscheinen durch Rundung als  $7^\circ$ . Eine Differenzierung der auftretenden Herdtiefen erfolgte in der klassischen Weise in flach ( $0 - 60$  km) und intermediär ( $70 - 300$  km), wobei sich die Beben im dargestellten Gebiet hauptsächlich in Herdtiefen von  $5 - 25$  km ereignen - intermediäre Beben dagegen nur im Herdgebiet von Vrancea (Rumänien) vornehmlich im Teufenbereich von  $90 - 140$  km.

GRÜNTHAL 1985

Abb. 1 Schadenbeben in Mitteleuropa

Fig. 1 Damaging earthquakes in Central Europe; circles: events before 1900, full circles: events after 1900

Diese Karte der Schadenbeben enthält Daten bis 1985. Ein Anspruch auf Vollständigkeit im Hinblick auf neueste Katalogversionen in den einzelnen europäischen Staaten kann mit dieser Darstellung nicht erhoben werden. Dennoch vermittelt diese Karte der Schadenbeben Mitteleuropas einen regional geschlossenen Überblick über die Seismizitätsverteilung, gemittelt über einen langen Zeitraum (für den größten Teil des dargestellten Gebietes wohl mehr als 500 Jahre). Die Karte gibt zwar keinerlei quantitative Aussage über die Größe der seismischen Gefährdung; aber die Tatsache des Vorhandenseins von Schadenbeben in bestimmten Gebieten spricht dafür, daß sie sich dort mit größerer Wahrscheinlichkeit wiederholen dürften als in Gebieten ohne solche Beben in den letzten Jahrhunderten, d. h., "daß sich von Zeit zu Zeit im gleichen Landstrich die gleichen Vorgänge mit mindestens der gleichen Stärke zu wiederholen pflegen" (SIEBERG, 1940).

Die Seismizität der DDR, dargestellt allein durch Schadenbeben, ist im Langzeitmittel im mitteleuropäischen Rahmen gering, aber nicht zu vernachlässigen. Sie ist im S-Teil der DDR, mit dem Aktivitätsschwerpunkt im vogtländischen Herdgebiet sowie nördlich angrenzenden Teilen, signifikant höher als in umliegenden z. T. nahezu aseismischen Gebieten, wie dem N-Teil der DDR einschließlich der Ostsee, der VR Polen, des tschechischen Teils der ČSSR (Böhmen) und benachbarten Teilen der BRD. Augrund dieser quasi singulären Stellung der Seismizität der DDR im mitteleuropäischen Raum bereitet die Umgrenzung eines optimalen Areals der Datenerhebung für die Katalogisierung keine besonderen Schwierigkeiten. Entsprechend der beobachteten Seismizität (siehe auch Abb. 8) wurde als Untersuchungs- bzw. Erhebungsgebiet das Territorium von  $49,6^{\circ}$ - $54,8^{\circ}$  nördlicher Breite sowie von  $9,5^{\circ}$ - $15,5^{\circ}$  östlicher Länge für die detaillierte, möglichst vollständige Katalogisierung festgelegt.

Von den Beben außerhalb dieses Untersuchungsgebietes sei lediglich auf einige signifikante entferntere Herdregionen hingewiesen:

Die spektakulärste makroseismische Beeinflussung in den letzten Jahren stellten wahrscheinlich die in etwa zwei Drittel des Territoriums der DDR spürbaren Fernwirkungen des Friuli-Bebens (N-Italien) am 6. Mai 1976 gegen 21 Uhr dar. Diese von einem Großteil der Bevölkerung wahrgenommenen Bodenbewegungen hatten lediglich eine Intensität von  $3^{\circ}$  - abgesehen von wenigen lokalen Wahrnehmungen der Stärke  $3,5$ - $4^{\circ}$  (hierbei ist der sogenannte Hochhauseffekt berücksichtigt, d. h., die Wahrnehmungen in den oberen Stockwerken von Hochhäusern sind auf die Erschütterungsstärken in normalen 1-2 stöckigen Bauten durch Abzug von  $0,1^{\circ}$  pro Stockwerk reduziert). Solche schwachen Wahrnehmungen werden in der DDR gleichfalls von relativ weit entfernten, stärksten Beben in Österreich, der Schweiz und in Skandinavien beobachtet. Als weitere Herdregionen, von denen deutliche Wahrnehmungen

(Intensitäten  $>= 4^{\circ}$ ) in größeren Gebieten in der DDR zu erwarten sind, wären zu nennen:

#### Niederrhein-Gebiet

Nur Beben mit Herdtiefen  $h$  größer  $10$  km werden mit Intensitäten von  $3$ - $4,5^{\circ}$  in weiten Gebieten des südwestlichen bis mittleren Teils der DDR gespürt; z. B. am

18. Februar 1756  
 $50,8^{\circ}\text{N}$   $6,5^{\circ}\text{E}$   $I_o = 8^{\circ}$   $h = 16$  km.

( $I_o$  - Epizentralintensität)

Beben mit den für dieses Herdgebiet typischen Herdtiefen werden nicht gespürt:

26. Aug. 1870  
 $50,9^{\circ}\text{N}$   $6,55^{\circ}\text{E}$   $I_o = 8^{\circ}$   $h = 8$  km  
 14. März 1951  
 $50,6^{\circ}\text{N}$   $6,7^{\circ}\text{E}$   $I_o = 7,5^{\circ}$   $h = 9$  km.

#### Oberrhein-Gebiet

Die Mehrzahl der bekannten stärksten Beben, die im südlichen Teil des Oberrhein-Gebiets ihren Herd hatten, wurden auf dem Gebiet der DDR wahrscheinlich mit Intensitäten kleiner  $4^{\circ}$  gespürt; z. B.

| 24. Nov. 1346                                |  |                     |
| $47,5^{\circ}\text{N}$ $7,6^{\circ}\text{E}$ |  | $I_o = 8^{\circ}$ , |
| 18. Okt. 1356                                |  |                     |
| $47,5^{\circ}\text{N}$ $7,6^{\circ}\text{E}$ |  | $I_o = 9^{\circ}$ . |

Nur starke Beben im nördlichen Abschnitt dieser Herdregion könnten im SW der DDR Intensitäten größer  $3,5^{\circ}$  verursachen; z. B. ähnliche Beben wie am

14. Feb. 1445  
 $50,0^{\circ}\text{N}$   $8,3^{\circ}\text{E}$   $I_o = 8^{\circ}$ .

#### Schwäbische Alb

Die stärksten Beben waren:

|  |  |                       |
|--|--|-----------------------|
| 16. Nov. 1911                              |  |                       |
| $48,2^{\circ}\text{N}$ $9^{\circ}\text{E}$ |  | $I_o = 8^{\circ}$ ,   |
| 28. Mai 1943                               |  |                       |
| $48,3^{\circ}\text{N}$ $9^{\circ}\text{E}$ |  | $I_o = 8^{\circ}$ ,   |
| 3. Sep. 1978                               |  |                       |
| $48,3^{\circ}\text{N}$ $9^{\circ}\text{E}$ |  | $I_o = 7,5^{\circ}$ , |

welche sämtlich mit Intensitäten von  $4^{\circ}$  in weiten Teilen im SW der DDR verspürt wurden (nur lokal vornehmlich südlich des Thüringer Waldes  $4,5^{\circ}$ ).

#### Fränkische Alb

Gut dokumentierte Wahrnehmungen existieren vom letzten starken Ereignis am

10. Okt. 1915  
 $48,8^{\circ}\text{N}$   $11,6^{\circ}\text{E}$   $I_o = 7^{\circ}$ ,

bei dem im südlichsten Teil der DDR Intensitäten von  $4^{\circ}$  beobachtet wurden. Bei den stärksten Beben dieser Herdregion (8. Feb. 1062,  $49^{\circ}\text{N}$   $12^{\circ}\text{E}$ ,  $I_o = 8^{\circ}$ ) dürften die Effekte um einen Grad höher liegen.

**Riesengebirge und angrenzende Gebiete**  
Beben mit maximalen Intensitäten von 7° sind aus dieser Region bekannt:

|               |                      |
|---------------|----------------------|
| 11. Juni 1895 | I <sub>0</sub> = 7°, |
| 50,7°N 17°E   |                      |
| 10. Jan. 1901 | I <sub>0</sub> = 7°. |
| 50,5°N 16,1°E |                      |

Typisch für diese Beben ist eine ausgeprägte Ausdehnung der makroseismischen Wirkungen entlang der Elbe bis in zentrale Teile der DDR.

### 3.2. Grundsätze für die Datenerfassung und Aufbau des Erdbebendaten-Files

Die wesentlichsten Prinzipien, die der Datenerfassung für den Katalog zugrundegelegt worden sind, lassen sich wie folgt zusammenfassen:

1. Datenerfassung in einer für die elektronische Datenverarbeitung zugänglichen Form
2. Möglichst vollständige Erfassung der Beben im zu katalogisierenden Gebiet
3. Aufnahme von Beben in den Katalog, wenn zumindest Zeitpunkt, Ort und Stärke einzelner Beben erfaßbar sind
4. Angabe von Schätzwerten für die wahrscheinlichen Fehler der wichtigsten Parameter
5. Erfassung von nichttektonischen Ereignissen ab Magnituden M >= 3
6. Kritische Prüfung von Angaben aus anderen Katalogen

### Zu 1. Computergerechte Datenerfassung

Zur optimalen Erarbeitung eines Kataloges, der gleichzeitig modernen Gesichtspunkten einer wissenschaftlichen Bearbeitung der Katalogdaten gerecht wird, bieten sich rechentechnische Hilfsmittel an. Damit war die Gestaltung des Katalogs weitgehend vorgegeben, da er mit vorhandenen computergerechten Bebenkatalogen möglichst kompatibel sein sollte, aber dennoch die Besonderheiten der Daten des Untersuchungsgebietes zu berücksichtigen waren.

Üblicherweise sind computergerechte Kataloge aus Sätzen mit einer Länge von 80 Zeichen (pro Beben) aufgebaut, die sich verteilen auf:

- Datum
- Koordinaten des Epizentrums
- Herdtiefe
- Magnituden
- makroseismische Daten
- sonstige Daten
- Quellenangaben

### Zu 2. Vollständige Datenerfassung

Trotz der Inhomogenität des verfügbaren Quellenmaterials wurde bei der Datenerfassung keine stärkeabhängige untere zeitliche Grenze für noch zu berücksichtigende minimale Intensitäten oder Magnituden zugrundegelegt; gleichfalls kein Zeitpunkt für den Beginn der Datenerhebung. Der zeitliche Beginn des Katalogs im Jahre 823 bezeichnet die Zeit, aus der die frühesten Berichte zu einem Erdbeben mit Herd im Untersuchungsgebiet überliefert sind. Die frühesten Katalogdaten stammen somit aus einer Zeit, aus der die ältesten schriftlichen Dokumente in und aus den zwischen Saale und Elbe gelegenen östlichen Grenzmarken des Karolingerreiches vorliegen.

Künftigen Nutzern des Katalogs soll es überlassen bleiben, die für sie zweckmäßigen Beschränkungen am zu verwendenden Datensatz vorzunehmen. Das betrifft insbesondere auch die vielen relativ schwachen Einzelstöße während der intensiven Bebenschwärme in den Jahren 1903 und 1908 – aber auch Mikrobeben bis zu negativen Magnituden vor allem ab 1973. Der zugrundeliegende Grundsatz war, die Bebendaten aus den sehr zerstreuten und zum großen Teil relativ schwer zugänglichen Quellen in einem einheitlichen Katalog zusammenzustellen und der Nutzung zugänglich zu machen.

Es wurde von dem Prinzip ausgegangen, die Datenerfassung bis zum Rande des Erhebungsgebietes in möglichst unvermindelter Vollständigkeit zu gewährleisten. Dabei waren auch Beben zu berücksichtigen, deren Herde nach kritischer Prüfung der vorliegenden Quellen schließlich außerhalb des definierten Erfassungsgebietes lokalisiert wurden.

### Zu 3. Minimalparameter im Katalog

Grundsätzlich existieren zu jedem Beben im vorliegenden Katalog Angaben zum Zeitpunkt, zu den Koordinaten des Epizentrums und zur Stärke, d. h. die Epizentralintensität und/oder eine Magnitudenangabe. Denn erst in der Weise quantifizierte Bebendaten gestatten umfangreiche weiterführende Untersuchungen, wie statistische Analysen, Berechnungen zur seismischen Gefährdung, die zeitliche Verteilung der seismischen Energiefreisetzung u.a.

Liegen z. B. über historische Bebenschwärme im Vogtland nur Angaben wie folgende vor: "1784, Januar 9. bis Februar 12. Ein Bebenbeschwerm im sächsisch/böhmischem Grenzgebiet" (nach SIEBERG, 1940), konnten sie somit keine Berücksichtigung im Katalog finden.

Die Lokalisierung anhand makroseismischer Daten erfolgte in der üblichen Weise, d. h. bei Vorliegen einer makroseismischen Karte durch Abschätzung des Schwerpunktes der am stärksten erschütterten Fläche. Wenn dies nicht möglich war, wurde jener Bebenort mit den stärksten angegebenen Bebenwirkungen als Epizentrum angenommen. Zur etwaigen Lokalisierung und Intensitätsbestimmung der ältesten Beben im Katalog wurden die Kar-

tendarstellungen bei SIEBERG (1940) herangezogen. Die dortige Signatur (erläutert in Abb. 1 bei SIEBERG) erlaubt eine grobe Intensitätsbewertung.

Da für die Beben des Untersuchungsgebietes bisher keine einheitlichen Verfahren zur Berechnung lokaler Magnituden Verwendung fanden, galt als ein weiteres Prinzip für die Datenerfassung, diese unterschiedlichen Magnitudendaten für ein und dieselben Beben samt Quellenangaben zu erfassen.

#### Zu 4. Fehlerangaben zu wichtigen Beben-Parametern

Mit den offensichtlichen Vorzügen, die ein Katalog, in dem die Informationen zu einzelnen Beben auf wenige Zahlenwerte reduziert sind, vor allem für die rechnergestützte Weiterverarbeitung der Daten bietet, sind allerdings auch Nachteile verbunden. Denn die Quantifizierung der Angaben zum Ort und zur Stärke, insbesondere für historische, vorinstrumentelle Beben oder nur unzulänglich makroseismisch erfaßte Beben, bringt z. T. erhebliche Probleme und Zweifel, die in der computergerechten Form des Katalogs nicht oder nur beschränkt zum Ausdruck gebracht werden können. Ein Katalog in der klassischen, verbal beschreibenden Form bietet diesbezüglich wesentlich mehr Möglichkeiten. Um dennoch den Katalognutzer auf die Zweifel des Bearbeiters hinsichtlich der festgelegten Beben-Parameter aufmerksam zu machen, wurden durchgängig für den Herdort, die Herdtiefe und die Epizentralintensität Schätzwerte für die wahrscheinlichen Fehler angegeben. Es ist nicht auszuschließen, daß einige der im Katalog angegebenen Schätzwerte für wahrscheinliche Fehler möglicherweise noch zu niedrig angenommen wurden. Dies beträfe möglicherweise einige der ältesten Beben bzw. schwache Stöße während des seismisch relativ aktiven Zeitabschnitts von 1897 - 1908.

#### Zu 5. Magnitudenbeschränkung für nicht-tektonische Ereignisse

Der vorliegende Katalog ist vorrangig auf tektonische Ereignisse orientiert. Nicht-tektonische Ereignisse sind grundsätzlich nur in den Katalog aufgenommen worden, sofern ihre Magnitude  $\geq 3$  war. Ebenfalls wurden die zahlreichen lokalen Einsenkungen (wiederholt mit Gebäudeschäden) durch natürliche Auslaugung, besonders in und im Raum Eisleben, nicht im Katalog berücksichtigt. (Eine bedeutende Serie ereignete sich von Dez. 1893 bis Sept. 1894 mit dem Maximum im Juni 1894. Entgegen der Angabe bei SPONHEUER (1952) "etliche Häuser stark gefährdet" mit dem Datum 15. Mai 1894 enthalten die lokalen Aufzeichnungen für diesen Tag keine Anhaltspunkte einer Aktivität.)

Somit fehlen im Katalog auch die Einstürze am Arendsee (Altmark);

811 als angebliches Entstehungsjahr des Sees infolge eines Einsturzes, weitere Hangrutschungen und markante Uferverän-

derungen in den Jahren 822, 823, 23.-25. Nov. 1685 (ABEL, 1850; ANONYM, 1931; SIEBERG, 1940);

gleichfalls fehlen die Einstürze der Altenberger Pinge im Erzgebirge nach SIEBERG (1940):

|              |  |
|--------------|--|
| 1545 Nov.    | Beginn der Pingenbildung,                    |
| 1583         | 3. Tote                                      |
| 1587         | 2. Einbruch                                  |
| 1620 Jan. 24 | 3. Einbruch                                  |
|              | 4. und Haupteinbruch,                        |
|              | 1 Totter, angeblich Spürbarkeit bis Dresden. |

#### Zu 6. Kritische Prüfung der vorliegenden Angaben

Bei der Ermittlung sämtlicher Katalogparameter, einschließlich der Fehlerschätzungen, stand das kritische und möglichst objektive Abwägen der einzelnen verfügbaren Fakten im Mittelpunkt. So erwiesen sich für einzelne Beben die Quellen als zu unsicher, so daß diese nicht in den Katalog aufgenommen wurden (z. B. Tilgung des Ereignisses von 1615 nach SIEBERG). Andererseits erscheint die Interpretation SIEBERGs, das Beben von 1680, nach Lersch in der Altmark, mit zweifelhaften Angaben zu einem Beben in Polen in Verbindung zu bringen, nicht gerechtfertigt. Weiterhin wurden Beben aus anderen Katalogen nicht aufgenommen, wenn nach neueren, eigenen Recherchen anzunehmen ist, daß deren Herde außerhalb des Untersuchungsgebietes liegen.

Als ein markantes Beispiel sei hier auf ein Schadenbeben am 26. Dezember 1693 hingewiesen - bei LEYDECKER und HARJES (1978) mit den Koordinaten 49,67°N und 10,17°E und der Epizentralintensität 7 - dessen Herd, nach den Angaben bei SIEBERG (1940), in einem sonst völlig aseismischen Gebiet positioniert ist. Die bei SIEBERG zu findenden Angaben: "1693, Dezember 26. ... zu Marktbreit litten Häuser empfindlichen Schaden, es sollen sogar einige eingestürzt sein..." dürften auf eine falsche Lesart der Beschreibungen bei HÄULEN (1743, "Jahr-Buch alter und neuer Nachrichten..., Oholzbach und Maynbernhain") zurückzuführen sein. HÄULEN schreibt: "Anno 1693. Man verspürte Erdbeben an vielen Orten, im Kayserlichen Lager zu Heilbronn wanketen die Zelt und fielen theils überhaufen. Der Kirchturm zu Marktbreit bewegte sich so stark davon, daß die Instrumenta herunter gesprungen und zerbrochen sind. Bäume wurden in Menge umgerissen, beladene Wagen umgeworfen und sogar viele Häuser fielen davon ein. In Summa der Schaden war sehr empfindlich".

Es scheint nicht gerechtfertigt, aus der allgemeinen Schlußbemerkung die Gebäude-Schäden auf Marktbreit zu beziehen. Für Marktbreit lag HÄULEN offenbar die sehr präzis überlieferte Wirkung des Bebens im dortigen Kirchturm vor. Mainbernhain, anscheinend die Wirkungsstätte des Autors, ist nahezu ein Nachbarort von Marktbreit, so daß HÄULEN über die Wirkungen dieses Bebens in Marktbreit sicher bestens unter-

richtet war und bei eventuellen dortigen Gebäudeschäden seinen Bericht anders verfaßt hätte. Desweiteren liegen sämtliche sonst bei SIEBERG genannten Orte (Heilbronn, Wiesbaden, Rheinfels, Frankfurt/M.) nicht in der Umgebung von Marktbreit, sondern wesentlich westlicher. Außerdem schreibt BOEGNER, 1847: "1693, den 16. December Mittags um 1 Uhr spürte man ein Erdbeben hier in Frankfurt a. M., welches in Rheinfels stark ... verspürt worden".

In ähnlicher Weise konnten zahlreiche Beben anderer Kataloge einer Neuinterpretation unterzogen werden, die so schließlich außerhalb des Untersuchungsgebietes lokalisiert wurden oder sich als nicht-tektonische seismische Ereignisse mit  $M \leq 3$  erwiesen.

Anhand der zum Beben von 1693 wiedergegebenen Zitate wird ein Eindruck von der Problematik vermittelt, die mit der Erstellung des Katalogs in der vorliegenden quantifizierten Form aus vorwiegend beschreibenden Angaben verbunden war.

### 3.3. Gestaltung des Bebenkatalogs und Erläuterungen

Aufbauend auf den genannten Grundsätzen wurde zur Datenerfassung der Erdbebendaten-File konzipiert. Entsprechend der Angaben zum Daten-File (Tabelle 1) erfolgt das Lesen der Katalogdaten von Magnetband (Satzlänge von 80 Zeichen pro Beben).

Der vollständige Bebenkatalog der DDR und angrenzender Gebiete von 823 bis 1984 ist im Anhang 1 wiedergegeben. Er umfaßt die bekannte Bebentätigkeit von  $49,6^\circ - 54,8^\circ\text{N}$  und  $9,5^\circ - 15,5^\circ\text{E}$ .

Auf der Grundlage der im Abschnitt 3.2. dargelegten Prinzipien für die Katalogisierung und der Konzeption für den Erdbebendaten-File erfolgt die Wiedergabe der Daten im Katalog-Ausdruck, unterteilt in 8 Daten-Gruppen: Datum/Herdzeit, Koordinaten, Region, Tiefe, Magnituden, makroseismische Daten, Sonstiges, Quellenangaben. Die Form der Eingangsdatei (Tabelle 1) ist nicht identisch mit der Ausgangsdatei, da einzelne Parameter decodiert oder zusätzliche Parameter erscheinen, die bei der rechnergestützten Datenausgabe aus katalogisierten Größen abgeleitet wurden. Die Mnemonik zum Katalog ist in Englisch ausgelegt.

Wie bereits im vorangehenden Abschnitt betont, existieren grundsätzlich zu jedem Beben im vorliegenden Katalog Angaben zum Zeitpunkt, zum Epizentrum und zur Stärke des Bebens.

#### Datum und Herdzeit (DATE)

Angabe von Jahr (YEAR), Monat (MO), Tag (DAY), Stunde (H), Minute (M), Sekunde (SEC); bis 1900 in MEZ, danach in UT. Bei historischen Beben werden nur die Daten genannt, die relativ sicher sind. Makroseismische Beschreibungen, wie "zwischen 7

und 8 Uhr", werden nicht als 7.30 Uhr sondern nur als 7 Uhr angegeben. Sofern Magnitudenangaben zu historischen Beben in den verwandten Quellen vorliegen, wurden diese trotz ihrer ansteigenden Unsicherheit in den Katalog aufgenommen. Ein Indikator (N1) kennzeichnet instrumentelle Zeitangaben (N1 = X); für makroseismisch bestimmte Zeiten erfolgt keine Angabe.

#### Koordinaten des Epizentrums (CO-ORDINATES)

Angabe von Breite (LATIT), Länge (LONGIT) sowie eines Indikators (N2), der auf eine instrumentelle Bestimmung des Epizentrums hinweist (N2 = X). Zu jedem Beben wird der geschätzte wahrscheinliche Fehlerradius des Epizentrums (ACCUR) vermerkt. Sechs Präzisionsklassen werden unterschieden: 2 km, 5 km, 10 km, 15 km, 30 km, >30 km.

#### Region (REGION)

Für die visuelle Arbeit mit dem Katalog erweist sich die verbale Beschreibung des Herdortes als äußerst vorteilhaft. Für die Katalogisierung war zwar die Angabe eines Regionen-Codes vorgesehen (Spalten 30 - 32), wurde aber nicht ausgeführt in Erhaltung einer für einen Bebenkatalog zugeschnittenen, geeigneten Ortszuweisung zu den Bebenkoordinaten zu Beginn der Erarbeitung des Katalogs in computergerechter Form. Allerdings ist die Regionenbezeichnung streng genommen ein redundanter Parameter, der mit Hilfe eines speziellen Computer-Unterprogramms unter Nutzung von Funktionsunterprogrammen nach GODKIN und PULLI (1984) automatisch zu den gegebenen Koordinaten zugeordnet wurde. Für den vorliegenden Katalog wurde das Untersuchungsgebiet hierzu in 57 Regionen eingeteilt, wobei die einzelnen Regionen geschlossene Polygonzüge mit maximal 7 Eckpunkten bilden. Die Abb. 2 zeigt die gewählten Regionen-Begrenzungen innerhalb des Untersuchungsgebietes mit den im Katalog verwandten Regionenbezeichnungen. In der Tabelle 2 ist der volle Wortlaut der auf 12 alphanumerische Zeichen begrenzten Regionenbezeichnungen wiedergegeben. Eine Änderung des Katalogs hinsichtlich beliebiger anderer Benennungen und Formgebungen der Regionen bzw. Gebietseinteilungen ist somit auf einfache Weise möglich.

Ausgangspunkt für die Regionen-Abgrenzung war die territoriale Verteilung der beobachteten Seismizität, d. h., in Gebieten relativ hoher seismischer Aktivität wurden relativ kleine Gebiete als eine Region umgrenzt und umgekehrt. Gruppierungen von Epizentren wurden nach Möglichkeit in einer Region zusammengefaßt, wobei allerdings zu betonen ist, daß die vorgestellten Regionen-Abgrenzungen nicht mit seismischen Herdregionen im Sinne der Seismotektonik oder der Methoden zur seismischen Gefährdungsbestimmung identisch sind.

Nach Abgrenzung der Regionen wurde versucht, ihnen geeignete geographische Bezeichnungen zuzuordnen, die sich vornehmlich zusammensetzen aus: Namen markanter Städte in der jeweiligen Region, Land-

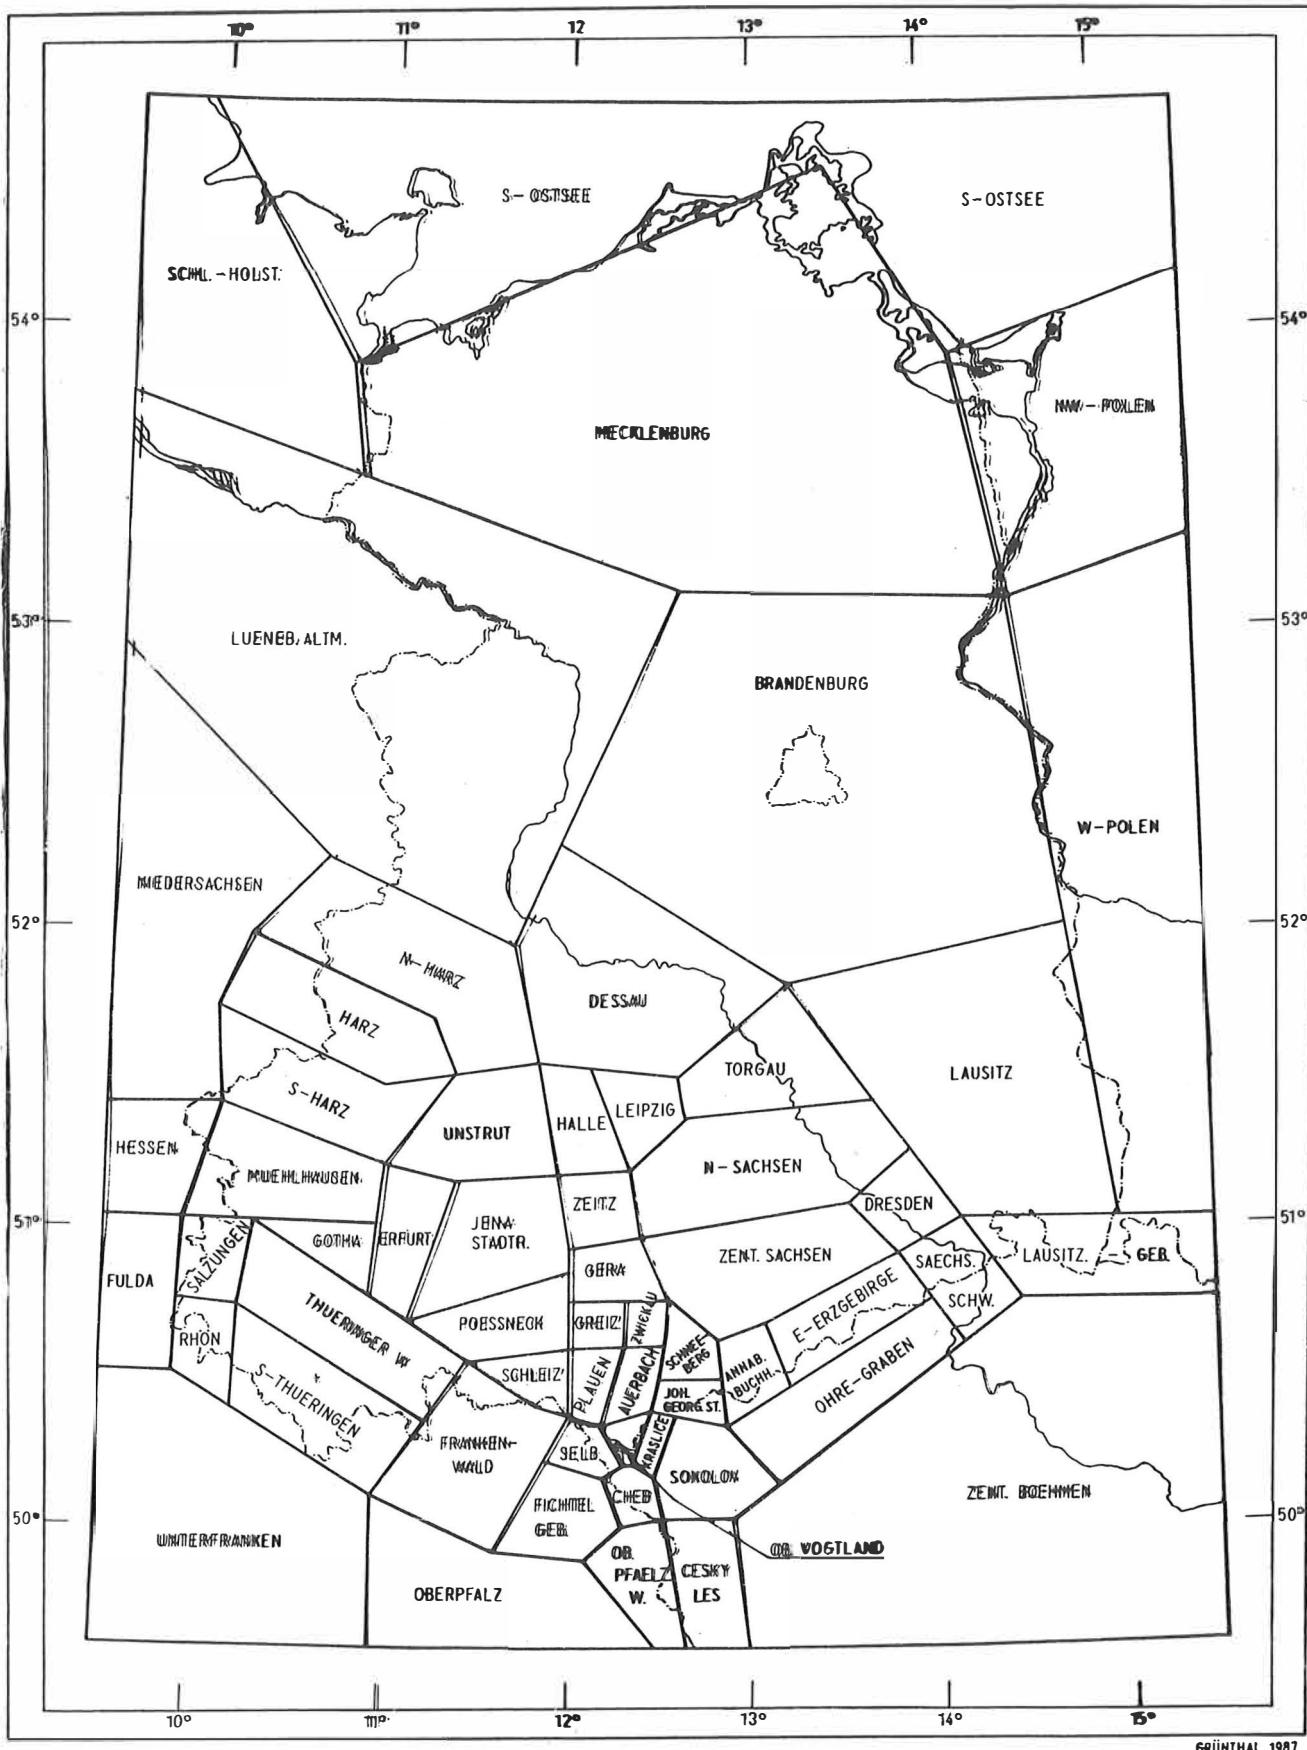

Abb. 2 Für den Bebenkatalog verwandte Regionen – deren Bezeichnungen und Begrenzungen.

schaftsbezeichnungen sowie Landesteilen. Eine volle Übereinstimmung mit z. B. gebräuchlichen Landschafts-Bezeichnungen (z. B. Thüringen, Erzgebirge, Oberfranken) konnte aufgrund feinerer Unterteilungen in den betreffenden Gebieten nicht berücksichtigt werden.

#### Herdtiefe (DEPTH)

Die Angabe der Herdtiefe in km erfolgte zumeist nach der makroseismischen Methode nach SPONHEUER (1960). Geschätzte Herdtiefenfehler werden entweder in ganzen Kilometern oder in 20 % bzw. 35 % der ermittelten Herdtiefe angegeben. Im Falle induzierter oder sonstiger seismischer Ereignisse ist die Tiefenangabe  $1 \pm 1,0$  km. Eine genauere Spezifizierung im 100 m-Bereich wurde nicht vorgenommen. Sofern eine Herdtiefenbestimmung nicht möglich war, erfolgt als Herdtiefen-Kennzeichnung  $9 \pm 5,0$  km - betreffende Beben liegen mit großer Wahrscheinlichkeit im gegebenen Herdtiefenbereich von 4 bis 14 km. Die Kombination  $9 \pm 5,0$  km ist nur für solche Fälle reserviert.

#### Magnituden (MAGNITUDES)

Wie bereits im Abschnitt 3.2. erwähnt, besteht für das Untersuchungsgebiet das Problem, daß die angewandten Magnitudenbestimmungen nicht einheitlich sind und die angegebenen Werte systematische Abweichungen um bis zu einer Magnitudeneinheit aufweisen. Dem wurde im Katalog Rechnung getragen durch die Angabe von 2 unterschiedlichen instrumentellen lokalen Magnituden  $M_i$  (ML1 und ML2) einschließlich ihrer Quellenangaben (RE) in alphanumerischer Codierung. Die Spalte ML2 ist vorrangig für die nach IIDA (1967) bestimmten Magnitudenwerte vorgesehen, wobei in der zugehörigen Quellenspalte ein fühlendes "I" auf die Verwendung der Relation nach IIDA hinweist.

Beginnend mit nachfolgend genannten Berichten, konnten instrumentelle Informationen verwertet werden:

ab Juli 1900:

Monatsberichte der kaiserlichen Hauptstation für Erdbebenforschung in Straßburg (siehe Beitr. zur Geoph. IV (1900) S. 427 ff., V (1903) S. 1 ff., VI (1904) S. 451 ff.)

ab 28. März 1902:

Daten der Erdbebenwarte Leipzig  
(siehe unter CREDNER sowie ETZOLD)

ab 1. April 1902:

Seismometrische Beobachtungen in Potsdam  
(HECKER, 1903)

ab Juli 1903:

Daten der seismometrischen Beobachtungen im Göttinger Geophysikalischen Institut  
(siehe unter v. d. BOHNE)

ab April 1905:

Monatliche Erdbebenberichte der seismischen Station zu Jena

In Tabelle 3 werden die alphanumerischen Codierungen der Quellenangaben zu den katalogisierten Magnitudenwerten erläutert.

Im Falle des Katalog-Parameters der makroseismischen Magnitude MM bot sich an, neben den in verwandten Quellen erwähnten und wiedergegebenen Daten, den Katalog hinsichtlich der MM-Daten bei vorliegenden Epizentralintensitäten  $I_o$  zu komplettieren. Dies sind im Katalog (Anhang 1) diejenigen Beben, für die keine Quellenangabe für MM erfolgt.

Bisher wurde allgemein für das Untersuchungsgebiet die Beziehung nach KÁRNÍK (1968) genutzt

$$M = 0,5I_o + \log h + 0,35, \quad (1)$$

(h in km)

nach der zum Beispiel für ein Beben mit  $I_o = 3 - 3,5$  in  $h = 9$  km Tiefe  $M = 2,9$  ist. Dieser Wert für M ist, insbesondere angesichts der zahlreichen für 1985 und 1986 vorliegenden Daten, deutlich größer als die berechneten  $M_i$ -Werte, die - in Abhängigkeit von der verwandten Methode - um ca. 0,8 bis 1,3 Magnitudeneinheiten kleiner sind. Besser schneidet für solche schwachen Beben die hierdtiefendifferente Relation nach KÁRNÍK (1968) ab

$$M = 0,63I_o + 0,5 \quad (2).$$

Diese ergibt aufgrund ihres größeren Anstiegs für das obige Beispiel einen um etwa 0,4 Magnitudeneinheiten kleineren Wert für M als die Relation (1).

Somit erschien die Ableitung einer speziellen Beziehung zwischen  $M_i$  und  $I_o$  für das Untersuchungsgebiet gerechtfertigt. Innerhalb der bis 1984 katalogisierten  $M_i$ - $I_o$ -Wertepaare lassen sich im wesentlichen 4 verschiedene Datentypen unterscheiden:

1. für den Zeitraum von 1900-1908 Magnitudenbestimmungen von SPONHEUER (IS) und  $I_o$ -Werte nach KUNZE sowie vom Autor (Abb. 5),
2. für den Zeitraum von 1962-1973  $M_i$ - und  $I_o$ -Werte nach SPONHEUER (Abb. 3),
3. für den Zeitraum von 1962-1984  $M_i$ -Werte nach IIDA vorwiegend nach NEUNHÖFER und GÜTH und  $I_o$ -Werte von SPONHEUER sowie vom Autor (Abb. 4),
4.  $M_i$ - und  $I_o$ -Werte für nichttektonische Ereignisse mit  $M_i \geq 3$  (Abb. 6).

Aus der Abb. 3 ist zu erkennen, daß SPONHEUER den  $I_o$ -Werten mit Zehntelgradabstufungen eine entsprechende  $M_i$ - $I_o$ -Relation bereits zugrundegelegt hatte, da es sonst völlig unüblich ist,  $I_o$ -Werte mit solcher Genauigkeit anzugeben, die anhand der Makroseismik nicht erreichbar ist. Der Schluß liegt nahe, daß die  $I_o$ -Werte nicht unabhängig, sondern aus Magnituden abgeleitet sind, d. h., daß die Abb. 3 lediglich die verwandte lineare Abhängigkeit widerspiegelt und der hohe Korrelationskoeffizient nicht real ist. Den Daten in der Abb. ge-

nügt unter Zugrundelegung der Definition, daß die makroseismische Magnitude in etwa gleich der Lokalmagnitude ist, die Relation

$$M = 0,66I_D - 0,11 \quad (3).$$

Die wenigen  $M_I$ -Daten im vorliegenden Katalog vom seismologischen Observatorium Gräfenberg nach der klassischen RICHTERschen Magnitudendefinition passen sich gut in die Relation (3) ein. Dies gilt gleichfalls für die zahlreichen Magnitudenbestimmungen nach der Beziehung von WAHLSTRÖM u. STRAUCH (1984) für die Beben des Schwarmes 1985/86 anhand der Aufzeichnungen im zentralisierten Stationsnetz der DDR.

Die  $M_I$ -Werte, die SPONHEUER für Beben von 1900-1908 angibt (Abb. 5), sind im Mittel um ca. 0,3 Magnitudeneinheiten größer als die Daten nach der Relation (3). Die IIDA-Magnituden (Abb. 4) sind dagegen im Mittel um ca. 0,6 - 0,7 Magnitudeneinheiten kleiner als nach der Relation (3).

Einen deutlich anderen Datentyp stellen die nichttektonischen Ereignisse in geringer Herdtiefe dar, für die sich anhand der katalogisierten Daten mit  $M >= 3$  folgender Zusammenhang ableiten läßt (Abb. 6):

$$M = 1,1I_D - 3,3 \quad (4).$$

Zur Komplettierung der MM-Daten im Katalog fanden somit die Relationen (3) und (4) Anwendung. Vor einer unkritischen Nutzung der MM-Werte für weiterführende Untersuchungen sei jedoch gewarnt. Sie sollten lediglich als ungefähre Richtwerte für mögliche Magnituden betrachtet werden.

#### Makroseismische Daten (MACROSEISMIC DATA)

Die Epizentralintensität (IMAX) wird in Graden der MSK-Skala (Anhang 2) angegeben, dazu eine Abschätzung zur Zuverlässigkeit des Intensitätswertes ( $Q$ ); falls angebbar, die mittleren Radien der 3°- und 5°-Isoseisten in km (R3 und R5) sowie der Hinweis auf eine im Zentralinstitut für Physik der Erde vorliegende Isoseistenkarte (ISOMAP = X). Intensitäten, die mit einer 1/2-Grad-Abstufung angegeben sind, sollen in der Regel zum Ausdruck bringen, daß z. B. für IMAX = 5,5 die betreffende Epizentralintensität des Bebens zwischen 5° und 6° anzunehmen ist.

Für  $Q = 0$  gilt pauschal eine Genauigkeit von kleiner/gleich  $\pm 0,5^\circ$ ; ist  $Q = 1$ , so ist der anhand der vorliegenden Quellen abzuleitende Intensitätswert zweifelhaft;  $Q = 2$  bedeutet einen Fehler von  $\pm 0,5$  bis  $1,0^\circ$ ;  $Q = 3$  eine Ungenauigkeit größer  $\pm 1^\circ$ .

#### Sonstige Daten (MISCELLANEOUS)

Unter "sonstige Daten" werden folgende Parameter zusammengefaßt:

- Indikator ( $K$ ) zur Art des Ereignisses
- Anzahl multipler Stöße mit gleichen vorliegenden Herdparametern (MULT)
- seismisches Moment (SMOM)
- Spannungsabfall (STRDROP)

|                |                              |
|----------------|------------------------------|
| K ohne Angabe: | tektonisches Beben           |
| K = 1          | : natürliches Einsturzbeben  |
| K = 2          | : induziert im Bergbaugebiet |
| K = 3          | : staudamminduziert          |
| K = 4          | : sonstiges Ereignis         |

Eine Besonderheit der historischen Vogtland-Bebendenaten besteht darin, daß verschiedentlich in den vorliegenden Quellen lediglich vermerkt ist, daß eine bestimmte Erschütterungsstärke am betreffenden Tag oder zur betreffenden Stunde mehrfach (i.d.R. unter Angabe der Anzahl) auftrat. Um diese Information im Katalog zu berücksichtigen, wurde unter MULT die Multiplizität einer Erschütterung mit ansonsten gleich angenommenen Herdparametern aufgenommen.

Von einigen Beben der jüngsten Zeit konnten anhand der digitalen Aufzeichnungen Herdparameter bestimmt werden (nach persönlicher Mitteilung H. GROSSERs, 1984). Hier von werden im Katalog das seismische Moment in Nm) sowie der Spannungsabfall (in MPa) angegeben.

Ein seismisches Moment von beispielsweise 2 mal  $10^{15}$  Nm wird im Katalog

|                         |         |
|-------------------------|---------|
| unter:                  | SMOM    |
|                         | NM      |
|                         | *10***X |
| angegeben als: 2.0 13 . |         |

Da für das Untersuchungsgebiet im katalogisierten Zeitraum lediglich eine Herdflächenlösung vorliegt (GRÄSSL u. a., 1984), fanden diese Herdparameter keine Berücksichtigung im Katalog.

#### Quellenangaben (REFERENCES)

In der Regel werden im vorliegenden Katalog nur die jüngsten Quellen zu einzelnen Beben angegeben. Dort bereits zitierte Quellen werden nur dann genannt, wenn sie zur Festlegung der Herdparameter des jeweiligen Bebens wesentlich beigetragen haben. Maximal können drei Quellen angeführt werden – insbesondere auch solche, die in bisherigen veröffentlichten Katalogen nicht herangezogen wurden. Der im neuen Katalog verwandte Quellen-Code ist in Tabelle 4 erläutert.

Die Katalog-Unterlagen von SPONHEUER und KUNZE (1981) enthalten zwar eine Zusammenstellung der verwandten Literatur – aber eine brauchbare Zuordnung von verwandten Quellen zu den einzelnen Beben existiert nicht. Im Literaturverzeichnis zum vorliegenden Katalog werden die Quellen aus der Literaturzusammenstellung bei SPONHEUER und KUNZE (1981) mit unmittelbarem Bezug zu den katalogisierten Beben genannt und mit einem + gekennzeichnet gemacht.

Eine Zusammenfassung sämtlicher Parameter des Bebenkatalogs mit der jeweiligen Kurzerläuterung wird in Tabelle 5 gegeben.

4. Charakteristik der Seismizität im Untersuchungsgebiet

## 4.1. Analyse der Vollständigkeit erfaßter Beben

Für eine Charakterisierung der Seismizität eines Gebietes oder für Abschätzungen zur seismischen Gefährdung besteht die Forderung, einerseits möglichst lange historische Zeiträume in die Analyse einzubeziehen und andererseits von möglichst vollständigen, hinsichtlich starker und schwacher Beben homogenen Datensätzen auszugehen. Dem steht als grundlegendes Problem entgegen, daß für historische Epochen weitaus weniger vollständige Bebenlisten vorliegen als für die Gegenwart, d. h., daß nur die stärksten Beben (Schadenbeben) bis weit in die Historie zurück nahezu lückenlos überliefert sein dürften. Dieser Widerspruch zwischen zu erfassenden langen, historischen Zeiträumen und Vollständigkeit kann durch eine für unterschiedliche Stärkeklassen unterschiedliche zeitliche Berücksichtigung der Katalogdaten kompensiert und damit eine hinreichende zeitliche Homogenität der Daten erreicht werden (GRÜNTHAL, 1985). Entscheidend hierfür ist eine zuverlässige Analyse der zeitlichen, intensitäts- bzw. magnitudenabhängigen Vollständigkeit der katalogisierten Daten.

Im folgenden sei die Zuverlässigkeit der Zeitangaben (mit Jahres-Genaugigkeit) und der Intensitätsangaben vorausgesetzt. Als zu verwendende Klassenbreite  $\Delta t$  der Zeitskala wurden 20-Jahres-Intervalle für den Bebenkatalog als optimal ermittelt. Die Mehrzahl der Stärkeangaben der katalogisierten Beben liegt als Epizentralintensitäten vor, unterteilt in halbe Grade, so daß diese makroseismische Größe als Bezugsparameter gewählt wurde. Aufgrund einer prinzipielle Unschärfe der makroseismischen Methodik ist eine Bestimmung der Epizentralintensitäten mit einer Halbgrad-Genaugigkeit nicht möglich, so daß die Epizentralintensitäten hauptsächlich als ganzzählige Grade im Katalog vorliegen und nicht in einem ausgewogenen Verhältnis von halben und ganzen Graden. Somit wurde als Intensitätsklassenbreite 1 Grad für die weiteren Betrachtungen verwandt. Bei Definition der Intensitätsklassen ist es von Bedeutung, ob beispielsweise ein Beben mit der Intensität  $6,5^\circ$ , mit Beben der Intensität  $6^\circ$  oder mit  $7^\circ$ -Ereignissen zu einer Klasse zusammengefaßt wird. Um zu keiner Überbewertung der Intensitätsdaten zu kommen, wurden halbe Grade jeweils dem kleineren ganzen Intensitätsgrad zugeordnet. Die kleinste makroseismisch relativ sicher erfaßbare Intensität ist der 3. Grad, so daß die Analyse der Beben mit Intensitäten  $>= 3^\circ$  vorgenommen wurde. Einige Beben im Vogtland wurden in der Zeit von 1962 bis Anfang der 70er Jahre makroseismisch nicht bearbeitet, so daß für diesen Zeitraum die in Intensitäten konvertierten Magnituden ergänzt sind. Eine Bearbeitung erwies sich für die katalogisierten Daten ab 1500 als sinnvoll. Somit ergeben sich für den Katalog 24 Intervalle  $\Delta t$  der Breite von 20 Jahren bis

| 1960 - 1979 |       | 217     | 55      | 8       | -       | -       |

einschließlich des Jahres 1979. Eine Besonderheit der Vogtlandbebendaten ist die Multiplizität einiger Ereignisse, so daß eine Analyse des Bebenkataloges hinsichtlich seiner Vollständigkeit einschließlich "multipler" Ereignisse sowie ohne "multiple" Ereignisse vorgenommen wurde.

An dieser Stelle sei betont, daß der Begriff "vollständig" nicht absolut zu werten ist, sondern im Sinne als "bis zu einem gewissen Grade vollständig", wobei allerdings der Grad der Vollständigkeit innerhalb der einzelnen Intensitätsklassen keine größeren Schwankungen aufweisen sollte. Anhand der tabellarischen Übersichten der Anzahl von Beben pro 20-Jahres-Intervall und pro Intensitätsklasse (Tabellen 6 u. 7) können bereits - nicht völlig frei von Subjektivität - die Zeitspannen abgeschätzt werden, bis zu denen die Daten der einzelnen Intensitätsklassen in gewissem Grade vollständig erfaßt sein könnten (Trennlinie in den Tabellen).

Die zeitliche Vollständigkeit ist im Untersuchungsgebiet nicht homogen verteilt. Im Herdgebiet der vogtländischen Schwarmbeben reicht z. B. die Vollständigkeit der Daten weitaus weniger in die Historie zurück als im übrigen Untersuchungsgebiet (vor ca. 1820 sind Einzelbeben innerhalb von Schwärmen quantitativ nicht oder nur äußerst lückenhaft faßbar).

Ausgenommen das Herdgebiet der vogtländischen Schwarmbeben dürften die Daten in den analysierten Intensitätsklassen für die nachfolgend genannten Zeiträume "vollständig" katalogisiert vorliegen:

| Intensitätsklasse | Zeitraum ab |
|-------------------|-------------|
| 3 - 3,5°          | ca. 1900    |
| 4 - 4,5°          | 1820        |
| 5 - 5,5°          | 1780        |
| 6 - 6,5°          | 1500        |
| 7 - 7,5°          | 1500        |

Bei der schwächsten Intensitätsklasse von 3-3,5° ist davon auszugehen, daß ab ca. 1900 zwar eine relativ große Vollständigkeit erreicht ist, aber ein Vollständigkeitsgrad wie in den anderen Intensitätsklassen wahrscheinlich nicht vorliegt. Ursache hierfür ist die prinzipielle Schwierigkeit der Erfassung von Beben mit Epizentralintensitäten von 3-3,5°, die in den Nachtstunden nur mit Einschränkungen möglich ist.

Erschwert wird diese Abschätzung durch beträchtliche natürliche zeitliche Schwankungen der seismischen Aktivität im Untersuchungsgebiet, die auch die befriedigende Anwendung der von SCHENK (1983) vorgeschlagenen Methodik nicht gestattet.

Für den Zeitraum ab 1500 zeichnet sich das 17. Jahrhundert durch recht wenige katalogisierte Beben aus, was wahrscheinlich nur teilweise auf die Wirren des 30-jährigen Krieges (1618-1648) zurückzuführen sein dürfte.

#### 4.2. Intensitäts-Häufigkeits-Verteilung

Die Magnituden- oder Intensitäts-Häufigkeits-Relation nach GUTENBERG und RICHTER

$$\log N(M) = a - bM \quad \text{oder} \quad \log N(I_0) = a^* - b^* I_0$$

ist ein gebräuchliches Hilfsmittel zur statistischen Analyse des Naturphänomens Erdbeben. Hierbei ist  $N$  die jeweilige Anzahl von Beben mit Magnituden  $M$  oder Epizentralintensitäten  $I_0$  im Intervall  $\Delta M$  oder  $\Delta I_0$ . Sind derartige Relationen normiert auf 1 Jahr, vermitteln sie direkt die mittlere jährliche Auftretens- oder Überschreitensrate bestimmter Bebenstärken im Untersuchungsgebiet, bzw. bezeichnet der Reziprokerwert der Auftretensrate die mittlere Wiederholungsperiode dieser Beben.

In der Abb. 7 sind die auf ein Jahr normierten nichtkumulativen und kumulativen Häufigkeiten (einschließlich multipler Ereignisse) von Epizentralintensitäten im Untersuchungsgebiet für die Intervalle, die in Tabelle 6 verwandt wurden, jeweils für die Zeiträume dargestellt, für die nach 4.1. eine relative Vollständigkeit erfaßter Beben anzunehmen ist. Das "Abknicken" zur Intensitätsklasse von 3-3,5° macht die bereits im vorigen Abschnitt erwähnte, im Vergleich zu den anderen Intensitätsklassen geringere relative Vollständigkeit der Beben dieser Klasse deutlich. Die Differenz der kumulativen zur nichtkumulativen Verteilung ist aufgrund der großen Anzahl der in die Darstellung eingegangenen Beben minimal.

Für Intensitäten größer 3-3,5° zeigt die Verteilung eine auffallend gute Übereinstimmung mit der GUTENBERG-RICHTER-Relation, was für einen hohen Grad der Homogenität der Ausgangsdaten sprechen dürfte.

#### 4.3. Räumliche Verteilung der Seismizität

Einen informativen Eindruck zur flächenmäßigen Verteilung der Seismizität im Untersuchungsgebiet vermittelt die Epizentrenkarte der Abb. 8. Dargestellt sind die natürlichen Erdbeben mit maximalen Intensitäten  $>= 3^\circ$  ohne Vor- und Nachbeben, d. h. die statistisch unabhängigen Ereignisse - zur Beschreibung des angewandten Verfahrens zur Separierung der unabhängigen Ereignisse siehe GRÜNTHAL (1985). Sofern es die Datendichte auf der Karte zuläßt, sind die Jahreszahlen zu den betreffenden Beben angegeben. Die Lokalisierungsfehler zu den Epizentren sind durch entsprechende Signaturen gekennzeichnet, wobei Beben mit Lokalisierungsfehlern größer 30 km nicht dargestellt sind.

Im vogtländischen Schwarmbebengebiet (schraffierte Fläche in Abb. 8) ist die Epizentrendichte auch der statistisch unabhängigen Ereignisse so groß, daß zur besseren Übersicht dieser Ausschnitt im doppel-

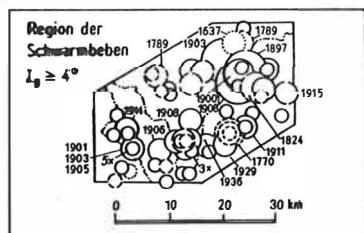

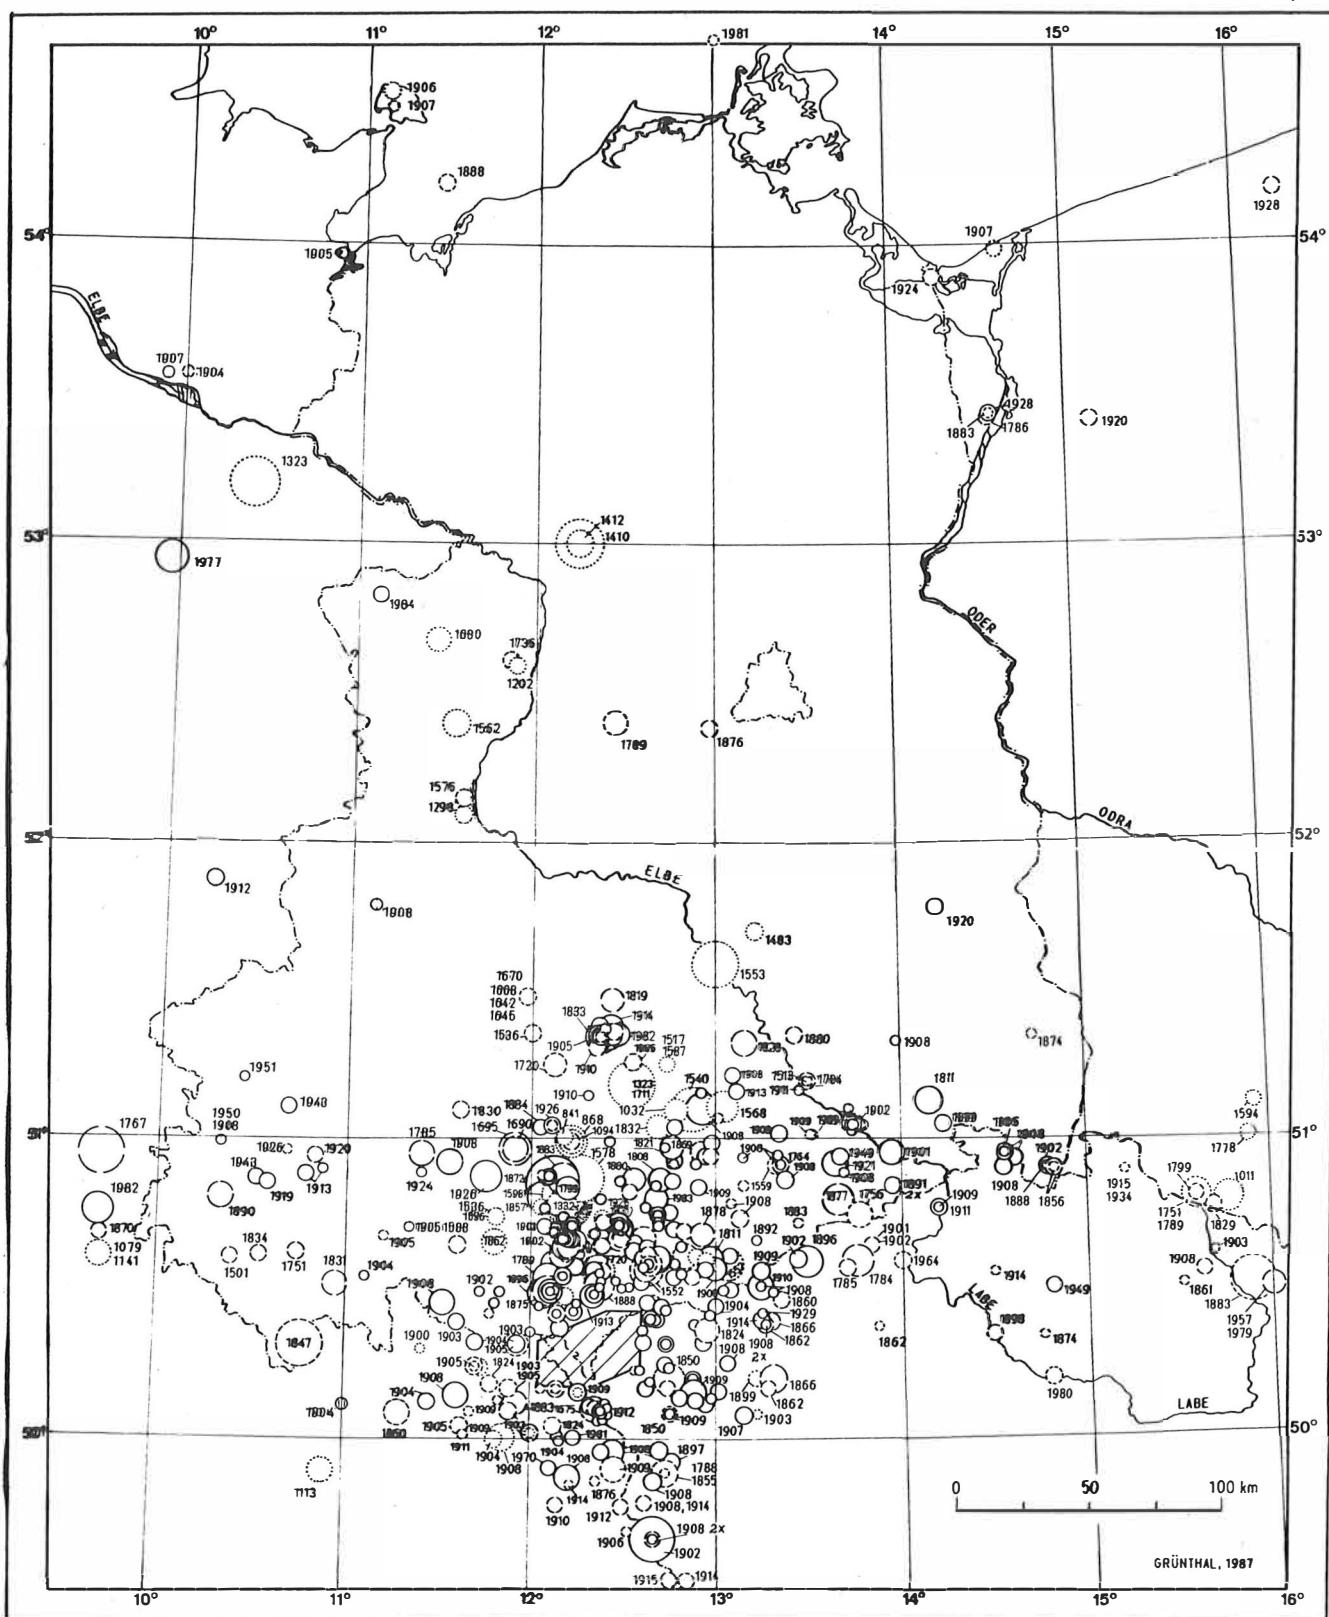

Abb. 8

Fig. 8 Epicentre map of earthquakes in the GDR and adjacent areas up to 1984; without foreshocks and aftershocks.

ERDBEFBN – FPIZENTREN

## ERDBEBEN-EPIZENTREN in der DDR und angrenzender Gebiete bis 1984

ERDREBEN = EP17

ten Maßstab für Beben mit  $I_0 \geq 4\alpha$  wieder-  
gegeben ist (unten links auf Abb. 8)

In erster Näherung entsteht der Eindruck,  
daß die gesamte Sächsisch-Thüringische  
Großscholle von Bebenherden bedeckt ist.  
Ein lokales, relativ eng begrenztes Gebiet  
maximaler Bebenaktivität stellt die Herd-  
zone der vogtländischen Schwarmbeben dar.  
Die räumliche Verteilung der Herde poten-  
tieller Schadenbeben zeigt zwar im S-Teil  
der DDR, östlich der Saale und südlich der  
Elbe, eine Häufung, wobei allerdings auch  
Gebiete mit relativ geringer seismischer  
Aktivität von potentiellen Schadenbeben  
nicht verschont zu sein scheinen. Bezüglich  
seismotektonischer Interpretationsversuche  
sei verwiesen auf GRÜNTHAL u.a. (1985a,  
1985b, 1987) sowie LUDWIG u.a. (1987).

Die vorliegenden katalogisierten Daten las-  
sen aufgrund unzureichender instrumenteller  
Registrierungen lediglich makroseismische  
Herdiefenbestimmungen zu. Von 86 Beben der  
letzten 160 Jahre liegen genügend detaillierte  
Isoseistenkarten vor, so daß hieraus  
nach der Methode von SPONHEUER (1960) die  
zugehörigen Herdtiefen bestimmt werden

konnten. Die jeweiligen geschätzten Herd-  
tiefenfehler sind im Erdbebenkatalog ange-  
geben. Als mittlerer makroseismischer Ab-  
sorptionskoeffizient ergaben sich bei An-  
wendung der Methode nach SPONHEUER Werte  
von  $0,001-0,005 \text{ km}^{-1}$ .

Die Abb. 9 zeigt die Häufigkeit der vorlie-  
genden Herdtiefen in 1-km-Intervallen, wo-  
bei ca. 80 % dieser Herdtiefendaten für  
Beben des vogtländischen Schwarmbebengebie-  
tes bestimmt wurden. Eine Interpretation  
dieser Tiefenverteilung im Hinblick auf die  
elastischen Gesteinseigenschaften im be-  
treffenden Erdkrustenabschnitt geben BAN-  
KOWITZ u.a. (1985) sowie BORMANN u.a. (1986).

Die Epizentren der für Magnituden  $\geq 3$  kata-  
logisierten nichttektonischen seismischen  
Ereignisse zeigt Abb. 10.  
Des Weiteren sind ausgewählte Herdgebiete  
nichttektonischer seismischer Ereignisse,  
in denen die maximalen Magnituden den Wert  
von 3 nicht überschritten, durch eine  
Schraffur wiedergegeben, wobei Gebiete na-  
türlicher Einstürze, wie Pingen aufgelassener  
Bergwerke und Erdfälle durch natürliche  
Auslaugung, gesondert ausgewiesen sind.

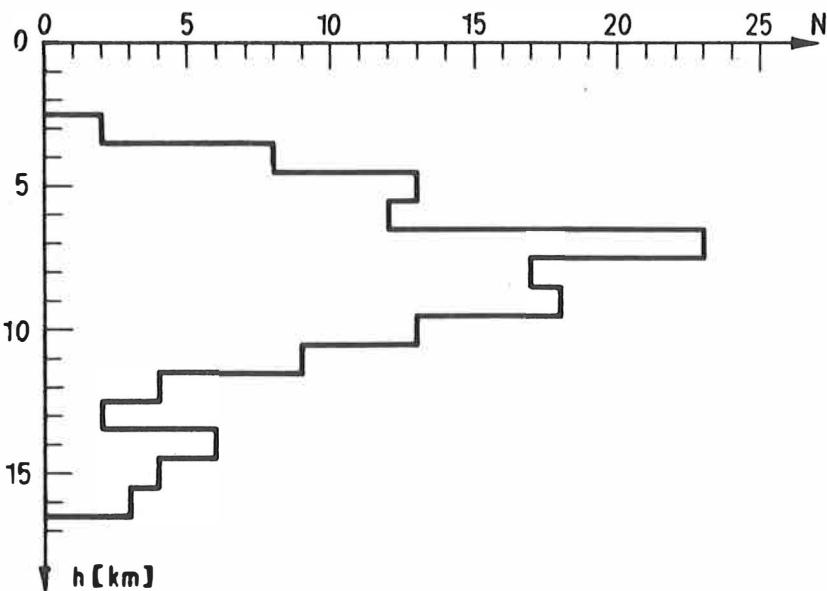

Abb. 9 Häufigkeitsverteilung makroseismisch ermittelter Herd-  
tiefen im Untersuchungsgebiet.

Fig. 9 Frequency distribution of macroseismically determined  
focal depths in the area under study.

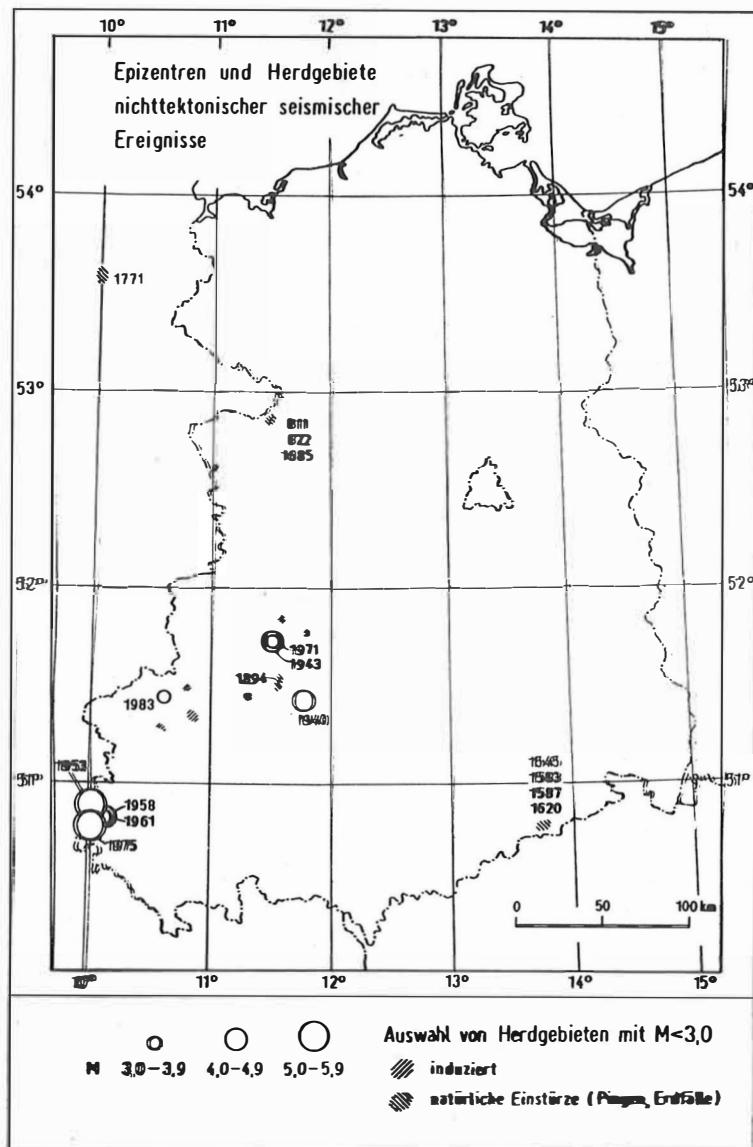

Abb. 10 Epizentren nichttektonischer seismischer Ereignisse mit Magnituden größer 3; Auswahl von Herdgebieten mit bisherigen Magnituden kleiner 3, unterschieden in Gebiete induzierter Ereignisse und natürlicher Einstürze.

Fig. 10 Epicentres of non-tectonic seismic events with magnitudes larger 3; selected focal areas of events with magnitudes hitherto smaller 3 differentiated in areas of induced events // and natural collapses //.

#### 5. Danksagung

Zur Erstellung des Katalogs hatten die Materialien von Prof. Dr. W. SPONHEUER und Ing. A. KUNZE, Jena, einen wesentlichen Anteil. Ihnen sei an dieser Stelle postum gedankt, auch für die nützlichen Diskussionen.

Mein besonderer Dank gilt Frau KÖRBER für ihre Unterstützung bei der Aufbereitung des größten Teiles der Daten. Dr. B. TITTEL, Collmberg, und Dipl.-Geophys. R. MITTAG, Berggießhübel, überprüften Teile des Katalogs anhand der Stationsaufzeichnungen. Dr. TITTEL gab wertvolle Hinweise zur Berech-

nung der Magnituden zum Bebenschwarm von 1936. Weiterhin danke ich den Kollegen vom Bereich Seismologie des Zentralinstituts für Physik der Erde für die Bereitstellung von Daten vom zentralisierten Stationsnetz des Instituts sowie für förderliche Hinweise zur technischen Ausführung. Dr. H. NEUNHÖFER stellte die Daten vom lokalen Stationsnetz im Vogtland zur Verfügung. Frau LÜCKEL sei gedankt für die Abschrift des Manuskripts des Textteils sowie Herrn PASCHKE für die Fertigung der Zeichnungen. Mein Dank gilt weiterhin Prof. Dr. P. KNOLL und Prof. Dr. P. BORMANN für die kritische Durchsicht des Manuskripts.

Anhang 2

Makroseismische Intensitätsskala MSK-80

nach: Report on the Ad-hoc Panel Meeting of Experts on Up-dating of the MSK-64 Seismic Intensity Scale, Jena (GDR), 10-14 March 1980; Gerl. Beitr. Geophys., Leipzig, 90 (1981) 3, 261 - 268.

---

### Klassifikation der Skala

**I. Bautypen (nicht erdbebenfest)**

- A: Bauten aus unbearbeiteten Feldsteinen, schlecht gearbeitete ländliche Bauten, Bauten aus luftgetrockneten Ziegeln (Adobe), Lehmgebäude;
- B: normale Ziegelbauten, Großblockbauten, Fachwerkbauten, Bauten aus behauenen Feldsteinen;
- C: vorgefertigte Beton- und Stahlbetonskelett-Bauweise, vorgefertigte Großplattenbauweise, gut gearbeitete Holzhäuser

**II. Definition der Anzahl**

|                   |               |
|-------------------|---------------|
| einzelne, wenige: | unter 10 %    |
| viele :           | 20 bis 50 %   |
| die meisten :     | mehr als 60 % |

**III. Einteilung der Bauschäden**

- Kategorie 1: leichte Beschädigungen
  - feine Risse im Verputz; Abbröckeln kleiner Putzteile.
- Kategorie 2: mäßige Beschädigungen
  - kleine Mauerrisse; größere Putzteile fallen ab; Abgleiten von Dachpfannen; Risse an Schornsteinen; Teile von Schornsteinen fallen ab.
- Kategorie 3: starke Beschädigungen
  - große und tiefe Mauerrisse; Abbrechen von Schornsteinen.
- Kategorie 4: Zerstörungen
  - Spalten im Mauerwerk; Bauteile können einstürzen; einzelne Bauteile verlieren ihren Zusammenhang; Einsturz von Innenwänden und Wandfüllungen des Skeletts.
- Kategorie 5: Totalschaden
  - völliger Einsturz von Gebäuden.

**IV. Einteilung der Skala**

- a) Personen und Umgebung
- b) Bauten
- c) Natur

### Intensitätsgrade

#### I. Unmerklich

- a) Die Intensität der Erschütterung liegt unterhalb der Fühlbarkeitsgrenze; das Beben wird nur mittels Seismographen nachgewiesen und aufgezeichnet.
- b) -
- c) -

#### II. Kaum merklich (sehr leicht)

- a) Die Erschütterung wird nur von einzelnen ruhenden Personen in Häusern, besonders in den oberen Stockwerken, gespürt.
- b) -
- c) -

#### III. Schwach

- a) Das Erdbeben wird in Gebäuden von wenigen Personen wahrgenommen, im Freien nur bei günstigen Umständen. Die Erschütterung ist schwach. Aufmerksame Beobachter bemerken ein leichtes Schwingen hängender Gegenstände, etwas stärker in den oberen Stockwerken.
- b) -
- c) -

#### IV. Größtenteils beobachtet

- a) Das Beben wird in Gebäuden von vielen, im Freien von wenigen Personen verspürt. Vereinzelt erwachen Schlafende. Schrecken wird nicht hervorgerufen. Die Erschütterung ist mäßig. Fenster, Türen und Geschirr klirren und klappern. Fußböden und Holzwände knarren. Möbelstücke beginnen zu erzittern. Hängende Gegenstände pendeln leicht. Flüssigkeiten in offenen Gefäßen schwingen leicht. In stehenden Autos ist die Erschütterung zu bemerken.
- b) -
- c) -

#### V. Stark

- a) Das Beben wird in Gebäuden von den meisten, im Freien von vielen beobachtet. Viele Schlafende erwachen, vereinzelt fliehen Personen ins Freie. Tiere werden unruhig. Das gesamte Gebäude erzittert merklich. Freihängende Gegenstände pendeln erheblich. Bilder verschieben sich. Pendeluhrn bleiben gelegentlich stehen. Wenig standfeste Gegenstände können umfallen oder verschoben werden. Offene Türen und Fenster schlagen auf und zu. Flüssigkeiten aus gut gefüllten Behältern laufen in kleinen Mengen über. Die Erschütterung ist stark; zuweilen dem Fallen eines schweren Gegenstandes im Gebäude ähnlich.
- b) Schäden der Kategorie 1 in einzelnen Bauten vom Typ A sind möglich.
- c) Vereinzelt ändert sich die Wasserergiebigkeit von Quellen.

#### VI. Leichter Schaden

- a) Von den meisten in Häusern und im Freien befindlichen Personen gefühlt. Viele Personen in Häusern werden erschreckt und fliehen ins Freie. Einzelne Personen verlieren ihr Gleichgewicht. Haustiere brechen aus ihren Ställen aus. In einigen Fällen können Geschirr und Gläser zerbrechen und Bücher herabfallen. Unter Umständen können Möbel von der Stelle gerückt werden und kleine Turmglocken anschlagen.
- b) Bei einzelnen Gebäuden vom Typ B und vielen vom Typ A entstehen Schäden der Kategorie 1, bei einzelnen Bauten vom Typ A Schäden der Kategorie 2.
- c) In einzelnen Fällen sind Risse bis zu 1 cm in feuchtem Boden möglich; in gebirgigem Gelände gelegentlich Erdrutsche; Veränderungen der Ergiebigkeit von Quellen und des Wasserstandes in Brunnen werden beobachtet.

## VII. Gebäudeschäden

- a) Die meisten Personen erschrecken und flüchten ins Freie. Viele bemerken Schwierigkeiten beim Stehen. Die Erschütterung wird von Personen in fahrenden Autos bemerkt. Große Glocken schlagen an.
- b) Bei vielen Gebäuden vom Typ C entstehen Schäden der Kategorie 1, bei vielen Häusern vom Typ B Schäden der Kat. 2. Viele Häuser vom Typ A erleiden Schäden der Kat. 3, einzelne der Kat. 4. In einzelnen Fällen Rutschungen an Fahrdämmen an steilen Hängen. Örtlich Risse in Straßen und Steinmauern.
- c) In Gewässern werden Wellen aufgeworfen und das Wasser durch aufgewirbelten Schlamm getrübt. Brunnen ändern ihren Wasserstand; die Wasserergiebigkeit von Quellen ändert sich. In einzelnen Fällen setzt bei trockenen Quellen die Wasserführung wieder ein, oder es versiegen Quellen. Vereinzelt gleiten kiesige oder sandige Ufersteile ab.

## VIII. Zerstörungen an Gebäuden

- a) Allgemeine Furcht; einige Personen fallen in Panik; auch gerade auto-fahrende Personen werden verwirrt. Hin und wieder brechen Zweige von Bäumen ab. Selbst schwere Möbel werden von der Stelle gerückt und teils umgestürzt. Teilweise werden Hängelampen beschädigt.
- b) Viele Gebäude vom Typ C erleiden Schäden der Kat. 2, vereinzelt der Kat. 3. Viele Gebäude vom Typ B erleiden Schäden der Kat. 3 und einzelne der Kat. 4. Viele Gebäude vom Typ A erleiden Schäden der Kat. 4 und einzelne der Kat. 5. Denkmäler und Statuen werden verschoben bzw. verdrehen sich, Grabsteine fallen um. Steinmauern stürzen ein.
- c) Kleine Erdrutsche in Vertiefungen und an Straßendämmen an steilen Böschungen; Risse im Boden bis zu einigen Zentimetern Breite. Neue Wasserreservoirs entstehen. Zuweilen füllen sich wieder trockene Brunnen, andere versiegen. In vielen Fällen ändern sich die Wasserergiebigkeit und der Wasserstand in Brunnen.

## IX. Allgemeine Gebäudeschäden

- a) Allgemeine Panik; beträchtliche Schäden an Möbeln. Tiere rennen durcheinander und schreien.
- b) Viele Gebäude vom Typ C erleiden Schäden der Kat. 3, einzelne der Kat. 4. Viele Gebäude vom Typ B zeigen Schäden der Kat. 4, einzelne der Kat. 5. Viele Gebäude vom Typ A mit Schäden der Kat. 5. Denkmäler und Statuen stürzen um. Wasserreservoirs können schwere Schäden zeigen. In einzelnen Fällen werden Eisenbahnschienen verbogen und Straßendämme beschädigt.
- c) Im Schwemmland von Flüssen wird häufig Austreten von Wasser, Sand und Schlamm beobachtet. Bodenrisse bis zu 10 cm Breite entstehen, an Hängen und Flußufern mehr als 10 cm; weiterhin eine große Zahl kleiner Bodenrisse. Bergstürze, viele Erdrutsche und Schlammflüsse; große Wellen auf Wasserflächen.

## X. Allgemeine Gebäudezerstörungen

- b) Viele Gebäude vom Typ C erleiden Schäden der Kat. 4, einzelne der Kat. 5. Viele Gebäude vom Typ B zeigen Schäden der Kat. 5, die meistens vom Typ A stürzen ein (Kat. 5). Wasserdämme, Deiche und Brücken können schwere bis bedrohliche Schäden zeigen. Eisenbahnschienen werden leicht gebogen. Im Straßenpflaster und Asphalt entstehen wellenartige Stauchungen.
- c) Im Boden zeigen sich Risse von einigen Dezimetern Breite, zuweilen bis zu 1 m. Parallel zu Wasserläufen entstehen breite Spalten. Lockerboden gleitet von den Hängen ab. An Flußufern und Steilküsten sind beträchtliche Landrutsche möglich; in Küstengebieten Sand- und Schlammverschiebungen; aus Kanälen, Seen und Flüssen wird Wasser aufs Land geworfen. Neue Seen entstehen.

## XI. Katastrophe

- b) Zerstörung (Kat. 4) der meisten und völliger Einsturz (Kat. 5) von vielen Gebäuden vom Typ C. Sogar bestkonstruierte Brücken und Dämme können zerstört werden; Eisenbahnschienen werden größtenteils verbogen oder verschoben;
- c) Es entstehen beträchtliche Veränderungen des Erdbodens durch breite Risse und Spalten sowie durch horizontale und vertikale Bewegungen; zahlreiche Landrutsche und Bergstürze. Die Intensität des Erdbebens bedarf besonderer Untersuchungen.

## XII. Landschaftsverändernd

- b) Praktisch alle Hoch- und Tiefbauten werden schwer beschädigt oder zerstört
- c) Die Erdoberfläche wird tiefgreifend umgestaltet. Beträchtliche Bodenrisse mit großen vertikalen und horizontalen Bewegungen werden beobachtet sowie ausgedehnte Bergstürze und Uferabbrüche. Wasserfälle entstehen, Flüsse ändern ihren Lauf. Die Intensität des Bebens bedarf besonderer Untersuchungen.
