Supplementary figure 1: Acquisition frequency and revisit time for the Sentinel-1 constellation. Mainland Europe and regions with active tectonics/volcanism share a repeat cycle of 6 days. Other regions share acquisitions every 12 days (© Copernicus data/ESA 2018).

Supplementary figure 2: Available polarization modes for the Sentinel-1 constellation. The default polarization mode is VV and most of the data are acquired in dual mode: VV/VH (© Copernicus data/ESA 2019).
